The following companies are major funders and supporters of the United Way *ALICE Project*.

**Aetna Foundation | AT&T | Atlantic Health System | Deloitte | Entergy | Johnson & Johnson
KeyBank | Novartis Pharmaceuticals Corporation | OneMain Financial
Thrivent Financial Foundation | UPS | U.S. Venture**

Note: In addition to the corporate sponsorships, this Report was made possible by the United Ways noted above in bold.

LETTER TO THE COMMUNITY

Dear New Yorkers:

Who is ALICE? You already know ALICE. We see ALICE every day – hard workers who keep New York’s economy running, but who aren’t always sure that they can put food on their tables. Each day ALICE stands at cash registers, fixes our cars, serves us in restaurants and retail stores, and cares for our children and our elderly.

ALICE stands for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mployed. We have produced this report to give an identity and voice to the people who work hard, often at more than one job, yet still struggle to make ends meet, whose wages are not sufficient to sustain them and their families, and who are one small emergency away from a major financial crisis.

What this report shows us is startling – that 44 percent of all New Yorkers are ALICE or live below the Federal Poverty Level. This means they are not earning enough to “get by” based on a Household Survival Budget that uses conservative estimates of monthly expenses for housing, child care, food, transportation, health care and taxes.

The report shows us that ALICE lives in every part of our state, from our biggest cities to our most rural areas. The cost of living varies widely in New York, and the report tells us what a survival budget is in every area of the state. It provides data at a county level to help us all understand our local communities. The report also tells us whether ALICE is a young person struggling in their first job, a family choosing between paying food or rent, or an elderly person on a fixed income.

We want to go deeper than counting the number of ALICE families and individuals. The report helps us to understand ALICE, but it also points to how we can help. There is information on the types of jobs ALICE has. It shows the pain points in the budget, the places that are the biggest challenge for ALICE, like rent or child care costs.

Recent federal data indicates that, after a tough recession, things may finally be improving. Poverty levels are dropping and income is rising. Here in New York, we have seen steps to raise the minimum wage, provide family leave, and tackle poverty in a systemic way in some of our poorest communities. What is less clear is if these positive changes will simply move households above the Federal Poverty Level, but not above the ALICE survival threshold.

By investing in ALICE, we are investing in ourselves. Stability in the lives of workers is positive for the companies that employ them and the overall economy. ALICE is working hard, and we need to identify solutions that make it easier for ALICE to become more financially secure.

United Ways across New York work year round to help people we call ALICE. Please join our efforts. Share information about ALICE, and please connect with your local United Way to learn how you can help create more opportunities for ALICE.

Sincerely,

THE UNITED WAY *ALICE* PROJECT

The United Way *ALICE* Project provides a framework, language, and tools to measure and understand the struggles of the growing number of households in our communities that do not earn enough to afford basic necessities, a population called ALICE. This research initiative partners with state United Way organizations, such as United Way of New York State, to deliver research-based reports that can stimulate meaningful discussion, attract new partners, and ultimately inform strategies that affect positive change.

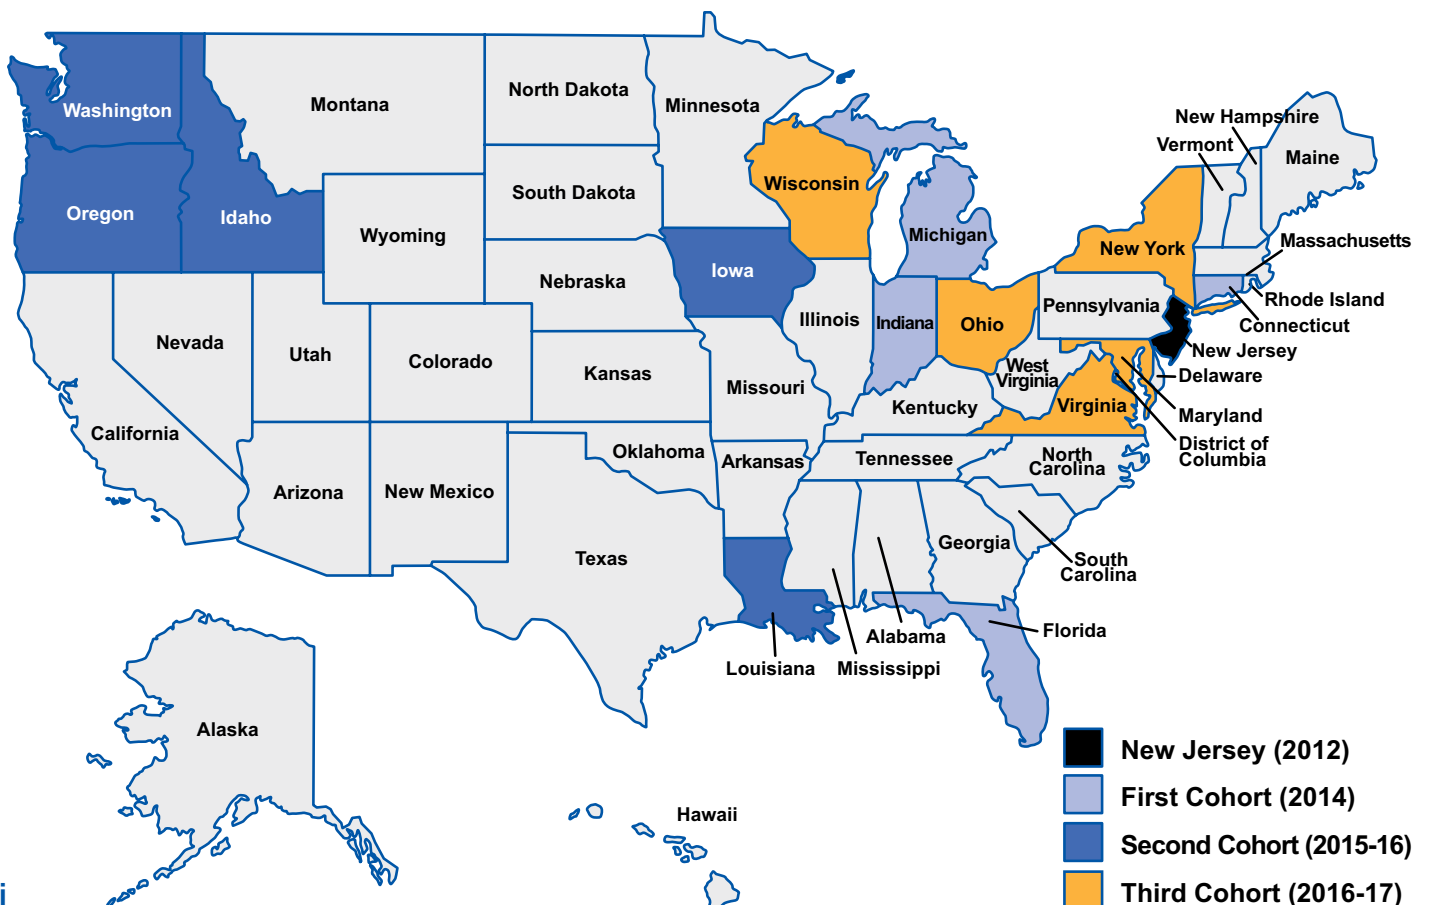

Based on the overwhelming success of this research in identifying and articulating the needs of this vulnerable population, the United Way *ALICE* Project has grown from a pilot in Morris County, New Jersey in 2009, to the entire state of New Jersey in 2012, and now to the national level with 15 states participating in the United Way *ALICE* Project.

More than one-third of households in the United States either live in poverty or are ALICE. United Way of New York State is proud to join the some 450 United Ways from the participating states to better understand the struggles of ALICE. The result is that ALICE is rapidly becoming part of the common vernacular, appearing in grant applications, in the media, and in public forums discussing financial hardship in communities across the country.

Together, United Ways, government agencies, nonprofits, and corporations have the opportunity to evaluate the current solutions and discover innovative approaches to give ALICE a voice, and to create changes that improve life for ALICE and the wider community.

To access reports from all states, visit UnitedWayALICE.org

States with United Way *ALICE* Reports

THE ALICE RESEARCH TEAM

The United Way *ALICE Project* provides high-quality, research-based analysis to foster a better understanding of who is struggling in our communities. To produce the United Way ALICE Report for New York, a team of researchers collaborated with a Research Advisory Committee, composed of 17 representatives from across the state, who advised and contributed to our United Way ALICE Report. This collaborative model, practiced in each state, ensures each United Way ALICE Report presents unbiased data that is replicable, easily updated on a regular basis, and sensitive to local context. Working closely with United Ways, the United Way *ALICE Project* seeks to equip communities with information to create innovative solutions.

Lead Researcher

Stephanie Hoopes, Ph.D. is the lead researcher and director of the United Way *ALICE Project*.

Dr. Hoopes' work focuses on the political economy of the United States and specifically on the circumstances of low-income households. Her research has garnered both state and national media attention. She began the United Way *ALICE Project* as a pilot study of the low-income community in affluent Morris County, New Jersey in 2009, and has overseen its expansion into a broad-based initiative to more accurately measure financial hardship in states across the country. In 2015, Dr. Hoopes joined the staff at United Way of Northern New Jersey in order to grow this work in new and innovative ways as more and more states become involved.

Dr. Hoopes was an assistant professor at the School of Public Affairs and Administration (SPAA), Rutgers University-Newark, from 2011 to 2015, and director of Rutgers-Newark's New Jersey DataBank, which makes data available to citizens and policymakers on current issues in 20 policy areas, from 2011 to 2012. SPAA continues to support the United Way *ALICE Project* with access to research resources.

Dr. Hoopes has a Ph.D. from the London School of Economics, a master's degree from the University of North Carolina at Chapel Hill, and a bachelor's degree from Wellesley College.

EXECUTIVE SUMMARY

Across New York, 44 percent of households struggled to afford basic household necessities in 2014.

WHO IS ALICE?

With the cost of living higher than what most people earn, **ALICE** families – an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mployed – have income above the Federal Poverty Level (FPL), but not high enough to afford a basic household budget that includes housing, child care, food, transportation, and health care. ALICE households live in every county in New York – urban, suburban, and rural – and they include women and men, young and old, and all races and ethnicities.

WHO IS STRUGGLING?

While the Federal Poverty Level reports that 15 percent of New York households face financial hardship, an additional 29 percent (2.1 million households) qualify as ALICE. The picture changes by region: In New York City, 20 percent are in poverty and another 31 percent are ALICE; in the counties surrounding NYC, 8 percent are in poverty and another 28 percent are ALICE; and in the Rest of State (everything north and west of NYC and its surrounding counties), 14 percent are in poverty and another 28 percent are ALICE.

WHY ARE THERE SO MANY ALICE HOUSEHOLDS IN NEW YORK?

Low wage jobs dominate the local economy: More than 55 percent of all jobs in New York pay less than \$20 per hour, with more than half of those paying between \$10 and \$15 per hour (\$15 per hour full time = \$30,000 per year). The percent of jobs paying less than \$20 per hour ranges greatly across the state, from 48 percent in the NYC metropolitan area to more than 65 percent in the metro areas of Elmira, Kingston, Glens Falls, Binghamton, and Utica-Rome. These jobs – especially service jobs that pay wages below \$20 per hour and require a high school education or less – will grow far faster than higher-wage jobs over the next decade.

The basic cost of living outpaces wages: The cost of basic household expenses in New York is more than most of the state's jobs can support. The average annual Household Survival Budget for a New York family of four (two adults with one infant and one preschooler) is \$62,472 – more than double the U.S. family poverty level of

\$23,850. Costs range across the state, with housing more expensive in NYC and its surrounding counties than in the Rest of State, but transportation costs are lower due to the availability of public transportation.

Economic conditions worsened for ALICE households from 2007 to 2014: The Economic Viability Dashboard shows that conditions worsened through the Great Recession on three indices – Housing Affordability, Job Opportunities, and Community Resources – in each county in New York. Conditions started to improve from 2010 to 2014 – especially job opportunities in NYC and its surrounding counties – but have not even returned to 2007 levels in most parts of the state. Finding both housing affordability and job opportunities in the same location remains a challenge for ALICE households.

Public and private assistance helps, but doesn't provide financial stability: The income of ALICE and poverty-level households in New York is supplemented with \$83.2 billion in government, nonprofit, and health care resources. If distributed evenly and allocated according to the need, that assistance would be enough to bring ALICE and poverty-level households to the ALICE Threshold. However, government spending is increasingly composed of health care spending, which consists of services and cannot be transferred to meet other needs such as housing or child care. As a result, the gaps in other areas are significant, including 34 percent in housing and 47 percent in child care. Health care is the only budget area where spending exceeds basic needs.

WHAT ARE THE CONSEQUENCES, AND WHAT WOULD IMPROVE THE ECONOMIC SITUATION FOR ALICE HOUSEHOLDS?

Consequences: When ALICE households cannot make ends meet, they are forced to make difficult choices such as forgoing health care, accredited child care, healthy food, or car insurance. These “savings” threaten their health, safety, and future – and they reduce productivity and raise insurance premiums and taxes for everyone. The costs are high for both ALICE families and the wider community.

Long-term change: While short-term strategies can make conditions less severe, only structural economic changes will significantly improve the prospects for ALICE and enable hardworking households to support themselves. Strengthening the New York economy and meeting ALICE's challenges are linked: Improvement for one would directly benefit the other. The ALICE tools can help policymakers, community leaders, and business leaders to better understand the number and variety of households facing financial hardship and to create more effective and lasting change.

GLOSSARY

ALICE is an acronym that stands for **A**sset Limited, **I**ncome **C**onstrained, **E**mloyed, comprising households with income above the Federal Poverty Level but below the basic cost of living.

The Household Survival Budget calculates the actual costs of basic necessities (housing, child care, food, health care, and transportation) in New York adjusted for different counties and household types.

The ALICE Threshold is the average level of income that a household needs to afford the basics defined by the Household Survival Budget for each county in New York. (Please note that unless otherwise noted in this Report, households earning less than the ALICE Threshold include both ALICE and poverty-level households.)

The Household Stability Budget is greater than the basic Household Survival Budget and reflects the cost for household necessities at a modest but sustainable level. It adds a savings category, and is adjusted for different counties and household types.

The ALICE Income Assessment is the calculation of all sources of income, resources, and assistance for ALICE and poverty-level households. Even with assistance, the Assessment reveals a shortfall, or Unfilled Gap, between what these households bring in and what is needed for them to reach the ALICE Threshold.

The Economic Viability Dashboard is comprised of three Indices that evaluate the economic conditions that matter most to ALICE households – Housing Affordability, Job Opportunities, and Community Resources. A Dashboard is provided for each county in the state.

Consequences of Households Living below the ALICE Threshold in New York

	Impact on ALICE	Impact on Community
HOUSING		
Live in substandard housing	Health and safety risks; increased maintenance costs; inconvenience	Increased health care costs; worker stressed, late, and/or absent from job – less productive
Move farther away from job	Longer commute; costs increase; severe weather can affect commuter safety; less time for other activities	More traffic on road; workers late to job; absenteeism due to severe weather can affect community access to local businesses and amenities; increased cost of urban sprawl including infrastructure and services such as roads, public transit, sewage, etc.
Homeless	Disruption to job, family, school, etc.	Costs for homeless shelters, foster care system, health care
CHILD CARE AND EDUCATION		
Substandard child care	Safety and learning risks; health risks; children less likely to be school-ready, read at grade level, graduate from high school; limited future employment opportunity	Future need for education and social services; less productive worker
No child care	One parent cannot work; forgoing immediate income and future promotions	Future need for education and social services
Substandard public education	Learning risks; limited earning potential/ mobility; limited career opportunity	Stressed parents; lower-skilled workforce; future need for social services
FOOD		
Less healthy	Poor health; obesity	Less productive worker/student; increased future demand for health care
Not enough	Poor daily functioning	Even less productive; increased future need for social services and health care
TRANSPORTATION		
Old car	Unreliable transportation; risk of accidents; increased maintenance costs	Worker stressed, late, and/or absent from job – less productive
No insurance/ registration	Risk of fine; accident liability; risk of license being revoked	Higher insurance premiums; unsafe vehicles on the road
Long commute	Costs increase; severe weather can affect commuter safety; less time for other activities	More traffic on road; workers late to job; increased demand for road maintenance and services
No car	Limited employment opportunities and access to health care/child care	Reduced economic productivity; higher taxes for specialized public transportation; greater stress on emergency vehicles
HEALTH CARE		
Underinsured	Delaying or skipping preventative health care; more out-of-pocket expense; substandard or no mental health coverage;	Workers report to job sick; spread illness; less productive; absenteeism; increased workplace issues due to untreated mental illness
No insurance	Forgoing preventative health care; use of emergency room for non-emergency care	Higher premiums for all to fill the gap; more expensive health costs; risk of health crises
INCOME		
Low wages	Longer work hours; pressure on other family members to work (drop out of school); no savings; use of high-interest payday loans	Worker stressed, late, and/or absent from job – less productive; higher taxes to fill the gap
No wages	Cost of looking for work and finding social services; risk of depression	Less productive society; higher taxes to fill the gap
SAVINGS		
Minimal savings	Mental stress; crises; risk taking; use costly alternative financial systems to bridge gaps	More workers facing crises; unstable workforce; community disruption
No savings	Crises spiral quickly, leading to homelessness, hunger, illness	Costs for homeless shelters, foster care system, emergency health care

AT-A-GLANCE: NEW YORK

2014 Point-in-Time Data

Population: 19,746,227 | **Number of Counties:** 62 | **Number of Households:** 7,289,792
Median Household Income (state average): \$58,878 (national average: \$53,657)
Unemployment Rate (state average): 7.3% (national average: 7.2%)
Gini Coefficient (zero = equality; one = inequality): 0.51 (national average: 0.48)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed, are households that earn more than the U.S. poverty level but less than the basic cost of living for the state (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households (44 percent) equals the total New York population struggling to afford basic needs.

Income Assessment for New York

The total annual income of poverty-level and ALICE households in New York in 2014 was \$85.6 billion, which includes wages and Social Security. This is only 50 percent of the amount needed just to reach the ALICE Threshold of \$169.4 billion statewide. Government and nonprofit assistance totals \$83.2 billion, but that still leaves an Unfilled Gap to achieve the most basic need in many areas, including 34 percent for housing and 47 percent for child care. Only health care spending exceeds basic needs.

What does it cost to afford the basic necessities?

This bare-minimum Household Survival Budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

Monthly Costs – New York Average – 2014			
	SINGLE ADULT	2 ADULTS, 1 INFANT, 1 PRESCHOOLER	PERCENT CHANGE, 2007–2014
Housing	\$668	\$919	17%
Child Care	\$-	\$1,363	9%
Food	\$202	\$612	20%
Transportation	\$330	\$653	11%
Health Care	\$141	\$564	56%
Miscellaneous	\$163	\$473	19%
Taxes	\$291	\$622	35%
Monthly Total	\$1,795	\$5,206	19%
ANNUAL TOTAL	\$21,540	\$62,472	19%
Hourly Wage	\$10.77	\$31.24	19%

Note: Percent increases are an average of the increases in each category for a single-adult and a four-person family.

AT-A-GLANCE: NEW YORK

INTRODUCTION

New York is known for a wide range of landmarks and landscapes, from Wall Street financial institutions and Broadway theater to the rural beauty of upstate New York, with its apple and dairy farms and tourist destinations. New York serves as a national and international center for a range of industries including fashion, literature, music, finance, and nanotechnology. It hosts the most Fortune 500 companies of any state – corporations including Verizon and many of the country’s largest financial institutions: JPMorgan Chase & Co., MetLife Insurance and Financial Service Provider, and Citigroup Inc.

Yet despite New York’s status as both a financial and cultural hub and home to vast natural resources, the state also contains sharp disparities in wealth and income. What is often overlooked is the growing number of households that earn above the Federal Poverty Level (FPL) but are unable to afford the state’s cost of living.

Traditional measures hide the reality that 44 percent of households in New York struggle to support themselves. Because income is distributed unequally in New York, there is both great wealth and significant economic hardship. That inequality increased by 22 percent from 1979 to 2014; now, the top 20 percent of New York’s population earns 54 percent of all income earned in the state, while the bottom quintile earns only 3 percent, the greatest difference of any state (see Appendix A).

In 2014, New York’s poverty rate was 15 percent, the same as the U.S. average, and the median annual household income was \$58,878, above the U.S. median of \$53,657. Yet the state’s overall economic situation is more complex, with large variations across New York and across industries. In many regards, New York has recovered from the Great Recession; its \$1.2 trillion GDP in 2014 was well above the 2007 level. New York had a more extreme employment trajectory – worse than the rest of the U.S. – during and after the Great Recession, but recently it has moved toward the national average, with 6.43 percent* unemployment in 2014 (near the national rate of 6.2 percent). However, most of the job growth has occurred in New York City, while other regions of the state have experienced declines.

None of the economic measures traditionally used to calculate the financial status of New York’s households, such as the FPL, consider the actual cost of living in each county in New York or the wage rate of jobs in the state. For that reason, those indices do not fully capture the number of households facing economic hardship across New York’s 62 counties.

The term “ALICE” describes a household that is Asset Limited, Income Constrained, Employed. ALICE is a household with income above the FPL but below a basic survival threshold, defined here as the ALICE Threshold. Defying many stereotypes, ALICE households are working households, composed of women and men, young and old, of all races and ethnicities, and they live in every county in New York – urban, suburban, and rural.

This United Way ALICE Report for New York provides better measures and language to describe the sector of New York’s population that struggles to afford basic household necessities. It presents a more accurate picture of the economic reality in the state, especially regarding the number of households that are severely economically challenged.

*Note: This is the New York state average unemployment rate for 2014 from the Bureau of Labor Statistics (BLS). The Executive Summary and Appendix J, the New York County Pages, use the 2014 state average unemployment rate from the American Community Survey, which was 7.2 percent, and the national average of 7.3 percent.

“Defying many stereotypes, ALICE households are working households, composed of women and men, young and old, of all races and ethnicities, and they live in every county in New York – urban, suburban, and rural.”

The Report asks whether conditions have improved since the Great Recession, and whether families have been able to work their way above the ALICE Threshold. It includes a toolbox of ALICE measures that provide greater understanding of how and why so many families are still struggling financially. Some of the challenges New York faces are unique, while others are trends that have been unfolding nationally for at least three decades.

This Report is about far more than poverty; it reveals profound changes in the structure of New York's communities and jobs. It documents the increase in the basic cost of living, the decrease in the availability of jobs that can support household necessities, and the shortage of housing that workers in the majority of the state's jobs can afford.

The findings are stark: The impact of the Great Recession was even greater than first realized, and for many New Yorkers, conditions have not improved in the four years since the technical end of the Recession in 2010. In 2007, 41 percent of New York households had income below the ALICE Threshold; that share increased to 43 percent in 2010 and to 44 percent in 2014. In contrast, the official U.S. poverty rate in New York reports that in 2014, only 15 percent, or 1,105,653 households, were struggling. But the FPL was developed in 1965; its methodology has remained largely unchanged despite changes in the cost of living over time; and it is not adjusted to reflect cost of living differences across the country.

The ALICE measures show how many households in the state are struggling, and they provide the new language needed to discuss this segment of our community and the economic challenges that so many residents face. In New York, there are 2.1 million ALICE households that have income above the FPL but below the ALICE Threshold. **When combined with households below the poverty level, in total, 3.2 million households in New York struggled to support themselves in 2014.**

ALICE households are working households; they hold jobs, pay taxes, and provide services that are vital to the New York economy, in a variety of positions such as retail salespeople, office clerks, food preparers, customer service representatives, and home health aides. The core issue is that these jobs do not pay enough to afford the basics of housing, child care, food, transportation, and health care. Moreover, the growth of low-skilled jobs is projected to outpace that of medium- and high-skilled jobs into the next decade. At the same time, the cost of basic household necessities continues to rise. Given these projections, ALICE households will continue to make up a significant percentage of households in the state.

“This Report is about far more than poverty; it reveals profound changes in the structure of New York's communities and jobs.”

REPORT OVERVIEW

Who is struggling in New York?

Section I presents the **ALICE Threshold**: a realistic measure for income inadequacy in New York that takes into account the current cost of basic necessities and geographic variation. In New York there are 3,232,792 households – 44 percent of the state's total – with income below the realistic cost of basic necessities; 1,105,653 of those households are living below the FPL, and another 2,127,139 are ALICE households.

- In NYC (3.1 million households) – which includes the five boroughs (or counties) of the Bronx, Brooklyn (Kings County), Manhattan (New York County), Queens, and Staten Island (Richmond County) – 20 percent of households are in poverty and another 31 percent are ALICE.

- In the counties surrounding NYC (1.6 million households) – Dutchess, Nassau, Orange, Putnam, Rockland, Suffolk, and Westchester – 8 percent of households are in poverty and another 28 percent are ALICE.
- In the Rest of State (2.5 million households) – which includes all counties outside NYC and its surrounding counties – 14 percent of households are in poverty and another 28 percent are ALICE.

This section provides a statistical picture of ALICE household demographics, including geography, age, race/ethnicity, gender, family type, disability, education, military service, and immigrant status. Except for a few notable exceptions, ALICE households generally reflect the demographics of the overall state population.

How costly is it to live in New York?

Section II details the average minimum costs for households in New York to simply survive – not to save or otherwise “get ahead”. It is well known that the cost of living in New York outpaces the state’s low average wages. The annual **Household Survival Budget** quantifies the costs of the five basic essentials of housing, child care, food, transportation, and health care. Using the thriftiest official standards, including those used by the U.S. Department of Agriculture (USDA) and the U.S. Department of Housing and Urban Development (HUD), the average annual Household Survival Budget for a New York family of four (two adults with one infant and one preschooler) is \$62,472, and for a single adult it is \$21,540. These numbers vary by county, but all highlight the inadequacy of the 2014 U.S. poverty designation of \$23,850 for a family and \$11,670 for a single adult as an economic survival standard in New York.

The same is true in the state’s three regions. The annual Household Survival Budget for a family of four is \$64,092 in NYC, \$78,720 in the counties surrounding NYC, and \$60,036 in the Rest of State. For a single adult, it is \$27,288 in NYC, \$25,476 in the counties surrounding NYC, and \$20,412 in the Rest of State.

The Household Survival Budget is the basis for the ALICE Threshold, which redefines the basic economic survival standard for New York households. Section II also details a **Household Stability Budget**, which reaches beyond survival to budget for savings and stability at a modest level. Even at this level, the Household Stability Budget is almost double the Household Survival Budget for a family of four in New York.

Where does ALICE work? How much does ALICE earn and save?

Section III examines where members of ALICE households work, as well as the amount and types of assets these households have been able to accumulate. With 55 percent of jobs in New York paying less than \$20 per hour, it is not surprising that so many households fall below the ALICE Threshold. In addition, the housing and stock market crash associated with the Great Recession, as well as high unemployment, took a toll on household savings in New York. More than 33 percent of New York households are asset poor, and 45 percent do not have sufficient liquid net worth to subsist at the FPL for three months without income.

How much income and assistance are necessary to reach the ALICE Threshold?

Section IV examines how much income is needed to enable New York households to afford the Household Survival Budget. This section also compares that level of income to how much households actually earn as well as the amount of public and private assistance they receive. The ALICE Income Assessment estimates that the income of ALICE and

“With 55 percent of jobs in New York paying less than \$20 per hour, it is not surprising that so many households fall below the ALICE Threshold.”

poverty-level households in New York is supplemented with \$83.2 billion in government, nonprofit, and health care resources. If distributed evenly, that assistance would be enough to bring all households to the ALICE Threshold. However, government spending is increasingly composed of health care spending, which consists of services and cannot be transferred to meet other budget needs. This leaves significant gaps in some areas, including a 34 percent gap in housing and a 47 percent gap in child care. Health care is the only budget area where spending exceeds basic needs.

What are the economic conditions for ALICE households in New York?

Section V presents the **Economic Viability Dashboard**, a measure of the conditions that New York's ALICE households actually face. The Dashboard compares three indices – Housing Affordability, Job Opportunities, and Community Resources – across the state's 62 counties. Both housing affordability and job opportunities worsened during the Great Recession. Conditions have not improved for housing, but job opportunities started to improve in 2010 – especially in NYC and the surrounding counties – though they have not yet even returned to 2007 levels. Community resources fluctuated but ultimately improved over the period. Given this economic landscape, it remains difficult for many ALICE households in New York to find both affordable housing and job opportunities in the same county, especially in NYC and its surrounding counties.

What are the consequences of insufficient household income?

Section VI focuses on how households survive without sufficient income and assets to meet the ALICE Threshold. It outlines the difficult choices ALICE households face, such as forgoing preventative health care, accredited child care, healthy food, or car insurance. These choices threaten their health, safety, and future, and have consequences for their wider communities as well.

Conclusion

The Report concludes by outlining the structural issues that pose the greatest challenges to ALICE households going forward. These include changes in the age and diversity of New York's population; job prospects for New Yorkers; and ALICE's leverage at the ballot box. This section also identifies a range of general strategies that would reduce the number of New York households living below the ALICE Threshold.

“Both housing affordability and job opportunities worsened during the Great Recession. Conditions have not improved for housing, but job opportunities started to improve in 2010 – especially in NYC and the surrounding counties – though they have not yet even returned to 2007 levels.”

“Because New York is economically, racially, ethnically, and geographically diverse, state averages mask significant differences between counties and even within counties, between municipalities.”

DATA PARAMETERS

The ALICE measures presented in this Report are calculated for each county. Because New York is economically, racially, ethnically, and geographically diverse, state averages mask significant differences between counties and even within counties, between municipalities. For example, the percent of households below the ALICE Threshold ranges from 28 percent in Saratoga County to 71 percent in Bronx County.

The ALICE measures are calculated for 2007, 2010, 2012, and 2014 in order to compare the beginning and the end of the economic downturn known as the Great Recession and any progress made in the four years since the technical end of the Recession. The 2014 results will also serve as an important baseline from which to measure both the continuing recovery and the impact of the Affordable Care Act in the years ahead.

This Report examines issues surrounding ALICE households from different angles, trying to draw the clearest picture with the range of data available. The Report uses data from a variety of sources, including the American Community Survey, the U.S. Department of Housing and Urban Development (HUD), the U.S. Department of Agriculture (USDA), the Bureau of Labor Statistics at the U.S. Department of Labor (BLS), the Internal Revenue Service (IRS), Child Care Aware (formerly NACCRRA), and these agencies' New York state counterparts. State, county, and municipal data is used to provide different lenses on ALICE households. The data are estimates; some are geographic averages, others are 1-, 3-, or 5-year averages depending on population size. Starting in 2014, 3-year averages are no longer produced by the American Community Survey, so data for all communities with populations of less than 65,000 will be 5-year averages.

I. WHO IS STRUGGLING IN NEW YORK?

Measure 1 – The ALICE Threshold

AT A GLANCE: SECTION I

- **ALICE** – **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed – defined: Despite being employed, many households earning more than the Federal Poverty Level (FPL) still cannot afford housing, child care, food, transportation and health care.
- In New York, there are 2.1 million ALICE households, while another 1.1 million households live below the poverty level. In total, 44 percent of New York households earn below the ALICE Threshold.
- Households with income below the ALICE Threshold – including both ALICE households and those living in poverty – make up between 28 and 71 percent of households in every county in New York.
- The racial and ethnic makeup of ALICE households varies as the makeup of the overall population varies across the state.
- More than one-third (36 percent) of senior households in New York qualify as ALICE, more than double the 14 percent of senior households in poverty.
- There are almost 2 million families with children in New York, and 44 percent of them (864,499) have income below the ALICE Threshold.
- Reflecting the changing household composition across the country, “other” households – single and cohabiting households younger than 65 with no children under 18 – account for 46 percent of the state’s households with income below the ALICE Threshold.
- Several demographic groups in New York are more likely to fall into the ALICE population, including women, LGBT people, people of color, those with lower levels of education, those with a disability, undocumented or unskilled immigrants, younger veterans, ex-offenders, and immigrants facing language barriers.

“There are almost 2 million families with children in New York, and 44 percent of them (864,499) have income below the ALICE Threshold.”

According to the U.S. Census Bureau, the federal poverty rate in New York increased through the Great Recession and beyond, from 13 percent in 2007 to 15 percent, or 1.1 million of the state’s 7.3 million households, in 2014. However, the continued demand for public and private assistance over the four years following the technical end of the Recession suggests that many more of the state’s households still struggle to support themselves.

The Federal Poverty Level (FPL) is no longer a realistic measure of financial hardship in households across each county in the U.S. Developed in 1965, the FPL no longer reflects the actual cost of basic household necessities. Its methodology has not been updated since 1974 to accommodate changes in the cost of living over time, nor is it adjusted to reflect cost-of-living differences across the country.

“The lack of accurate information about the number of people who are ‘poor’ distorts the identification of problems related to poverty, misguides policy solutions, and raises questions of equality, transparency, and fairness.”

There have been extensive critiques of the FPL and arguments for better poverty measures (O’Brien and Pedulla, 2010; Uchitelle, 2001). The official poverty level is so understated that many government and nonprofit agencies use multiples of the FPL to determine eligibility for assistance programs. For example, New York’s Lifeline Assistance uses 135 percent of the FPL to determine eligibility for affordable wireless service. Both the New York Summer Food Service Program and the New York School Breakfast and Lunch Program use 185 percent of the FPL (New York State Department of Public Service, 2016; Benefits.Gov, 2016). Even federal programs such as Medicaid and the Children’s Health Insurance Program (CHIP) use multiples of the FPL to determine eligibility across the country (National Conference of State Legislatures, 2014; Roberts, Povich and Mather, 2012).

Recognizing the shortcomings of the FPL, the U.S. Census Bureau developed an alternative metric, the Supplemental Poverty Measure (SPM), which is based on expenditures reported in the Bureau of Labor Statistics’ (BLS) Consumer Expenditure Survey (CES) and adjusted for geographic differences in the cost of housing. The SPM was meant to capture more of New York’s struggling households, but because it is not based on the actual cost of basic goods, it remains similar to the official FPL: New York’s 2013 SPM 3-year average was 17.5 percent, while the FPL 3-year poverty estimate was 16 percent (U.S. Census Bureau, 2014; Short, 2013).

Despite its shortcomings, the FPL has provided a standard measure over time to determine how many people in the U.S. are living in deep poverty. The needs and challenges that these people face are severe, and they require substantial community assistance. The definition of “poverty”, however, is vague, often has moral connotations, and can be inappropriately – and inaccurately – associated only with the unemployed. **To clarify the economic challenges that working households face, this Report measures what it actually costs to live in each county in New York; calculates how many households earn below that level; and offers an enhanced set of tools to describe the impact of financial hardship on them and on their communities.**

This is not merely an academic issue, but a practical one. The lack of accurate information about the number of people who are “poor” distorts the identification of problems related to poverty, misguides policy solutions, and raises questions of equality, transparency, and fairness. Using the FPL may also over-report the number of households facing financial hardship in areas with a low cost of living and under-report the number in areas with a high cost of living. For example, the Geography of Poverty project at the U.S. Department of Agriculture (USDA) finds that nearly 84 percent of persistent-poverty counties are located in the South (USDA, May 2015), a region of the country with a lower cost of living. By the same token, there may be just as many households struggling in other regions where the cost of living is higher, but they are often not counted in the official numbers. The ALICE Threshold, which takes into account the relative cost of living at the local level, enables more meaningful comparisons across the country.

INTRODUCING ALICE

Many individuals and families in New York do not earn enough to afford the five basic household necessities of housing, child care, food, transportation, and health care. Even though many are working, their income does not cover the cost of living in the state, and they often require public assistance to survive.

Until recently, this group of people was loosely referred to as the working poor, or technically defined as the population in the lowest two income quintiles. The term “**ALICE**” – **A**sset **L**imited, **I**ncome **C**onstrained, **E**mployed – more clearly defines this population as households

with income above the official FPL but below a newly defined basic survival income level. ALICE households are as diverse as the general population, composed of women and men; young and old; of all races and ethnicities; living in rural, urban, and suburban areas.

THE ALICE THRESHOLD

In New York, where the cost of living is high, it is especially important to have a current and realistic standard that reflects the true cost of economic survival and compares it to household incomes across each county. **The ALICE Threshold** is a realistic standard developed from the **Household Survival Budget**, a measure that estimates the minimal cost of the five basic household necessities – housing, child care, food, transportation, and health care. **Based on calculations from the American Community Survey and the ALICE Threshold, 3.2 million households in New York – 44 percent – are either in poverty or qualify as ALICE (Figure 1).**

Figure 1.
Household Income, New York, 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

Based on the Household Survival Budget and average household size, the ALICE Threshold is calculated in each county for two sets of households: those headed by someone younger than 65 years old and those headed by someone 65 years and older. Because the basic cost of living varies across the state, the ALICE Threshold for New York households headed by someone under 65 years old ranges from \$40,000 to \$75,000 per year. For older households, the ALICE Threshold ranges from \$30,000 to \$50,000 per year. The methodology for the ALICE Threshold is presented in Appendix B; the ALICE Threshold for each county is listed in Appendix J, the ALICE County Pages.

ALICE OVER TIME

The impact of the Great Recession on New York's economy dramatically shaped household demographics, and that trend continued in the four years following the technical end of the downturn, 2010 to 2014.

Throughout the 2007-2014 period, the total number of households in New York grew from 7.1 million in 2007 to 7.2 million in 2010 to 7.3 million in 2014, a 3 percent increase (Figure 2). With the growth in population, the number of households that are struggling to meet their basic needs has grown even more:

"In New York, where the cost of living is high, it is especially important to have a current and realistic standard that reflects the true cost of economic survival and compares it to household incomes across each county."

- **Poverty:** The number of households increased steadily from 922,992 households in 2007 to 1.1 million households in 2014, an 18 percent increase.
- **ALICE:** The number of ALICE households increased from 2007 to 2010, then fluctuated, ending at 2,127,139 households in 2014 – a net increase of 8 percent from 2007 to 2014.
- **Above ALICE Threshold:** The number of households above the ALICE Threshold moved in the opposite direction, falling from 2007 to 2010, then fluctuating and reaching 4.1 million households in 2014. As a percentage of total households, the number fell by 4 percent from 2007 to 2014.

Figure 2.
Households by Income, New York, 2007 to 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

These statistics don't fully capture fluidity; beneath the static numbers, households are moving above and below the ALICE Threshold over time as economic and personal circumstances change. The U.S. Census reports that from January 2009 to December 2011, 31.6 percent of the U.S. population was in poverty for at least two months. By comparison, the national poverty rate for 2010 was 15 percent (Edwards, 2014). Household income is fluid, and ALICE households may be alternately in poverty or more financially secure at different points during the year.

“Household income is fluid, and ALICE households may be alternately in poverty or more financially secure at different points during the year.”

WHERE DOES ALICE LIVE?

ALICE lives across New York, in every county and every town. Contrary to some stereotypes, ALICE families live in rural, urban, and suburban areas.

ALICE by Region

New York varies greatly by region – particularly New York City, the counties surrounding the city, and the Rest of State (used here to include everything outside NYC and its surrounding counties). This section examines the income levels of the state's 7.3 million households across these three regions. While the percent of households in poverty ranges greatly, the percent of ALICE households is virtually the same across the three regions.

New York City, which includes the 5 boroughs (or counties) of the Bronx, Brooklyn (Kings County), Manhattan (New York County), Queens, and Staten Island (Richmond County), is

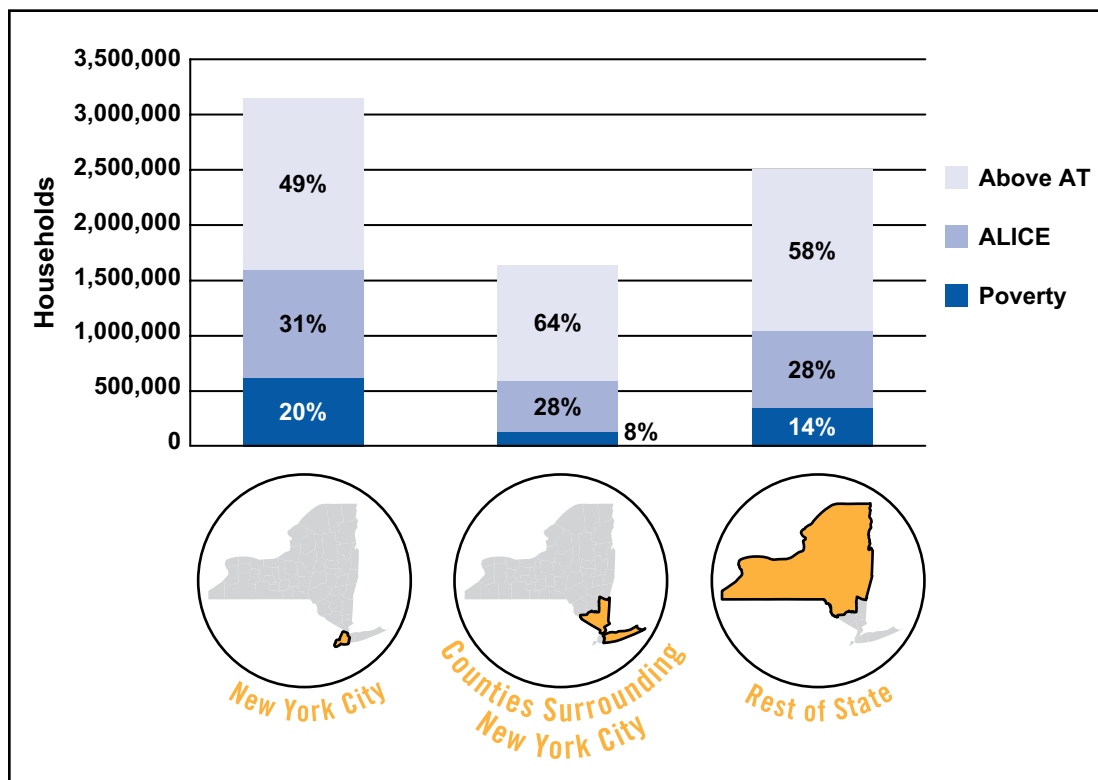

the largest region in terms of population but the smallest in geography. Of the city's 3.1 million households, 20 percent are in poverty, another 31 percent are ALICE, and 49 percent have income above the ALICE Threshold.

By contrast, the counties immediately surrounding NYC – Dutchess, Nassau, Orange, Putnam, Rockland, Suffolk, and Westchester counties – make up the smallest region by population (1.6 million households). This is a higher-income region than NYC: The poverty rate here is less than half of that in NYC at 8 percent; the percent of ALICE households is exactly the same at 28 percent; and the percent of households above the ALICE Threshold is much higher at 64 percent.

The Rest of State covers a much larger area than the other two regions but has a moderate population, especially considering its geographic size. This region encompasses both vast rural areas and metro areas including Albany, Buffalo, Rochester, and Syracuse. Of the region's 2.5 million households, 14 percent are in poverty, another 28 percent are ALICE, and 58 percent have income above the ALICE Threshold.

“Even within each region, there is variation between counties in terms of both population size and the share of poverty and ALICE households.”

Figure 3.
Households by Income, New York Regions, 2014

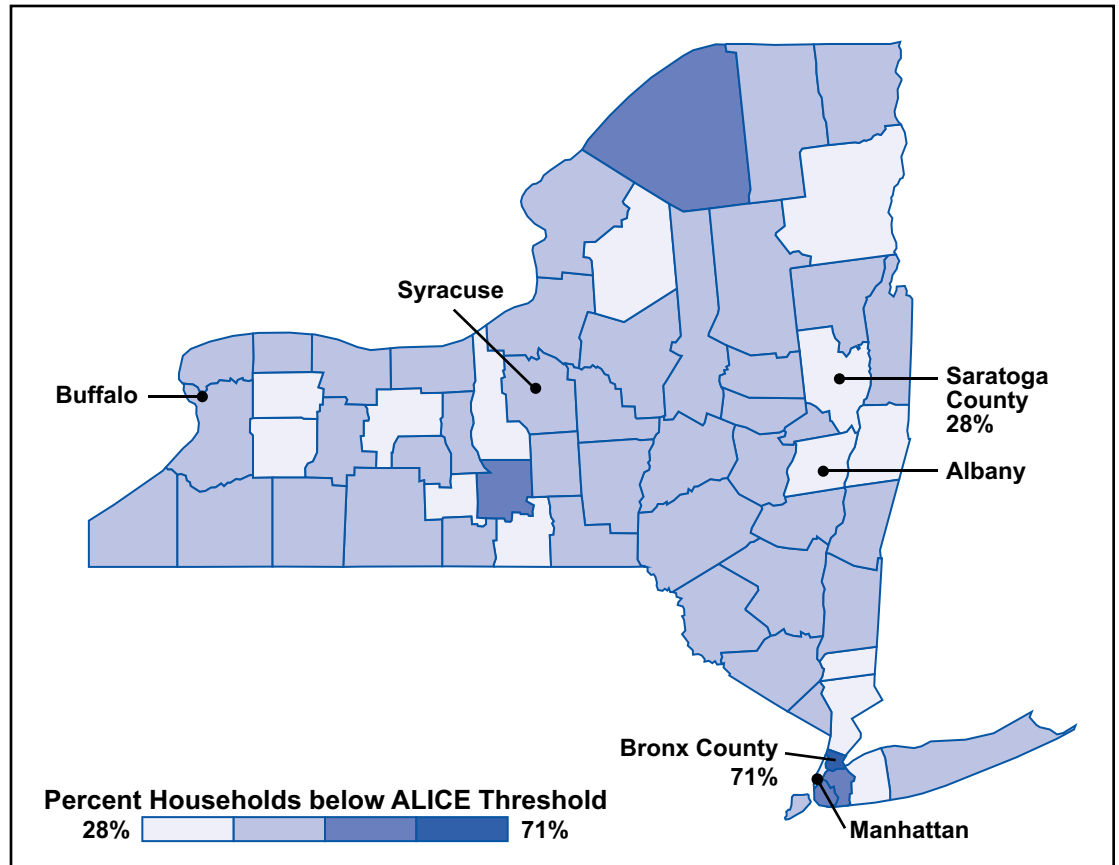

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

Even within each region, there is variation between counties in terms of both population size and the share of poverty and ALICE households. Figure 4 shows that households living below the ALICE Threshold constitute a significant percentage of households in all New York counties:

- **Below the ALICE Threshold (including households in poverty):** Percentages range from 28 percent in Saratoga County to 71 percent in Bronx County.
- **Poverty:** Percentages range from 5 percent in Putnam County to 31 percent in Bronx County.
- **ALICE:** Percentages range from 19 percent in New York County (Manhattan) to 40 percent in Bronx County.

Figure 4.

Percent of Households below the ALICE Threshold by County, New York, 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

Another measure of economic conditions in a county is the persistence of economic hardship over time. Two of New York's 62 counties – Bronx and Kings (Brooklyn) counties – are persistent-poverty counties, where 20 percent or more of the population has lived in poverty over the last 30 years (USDA, May 2015).

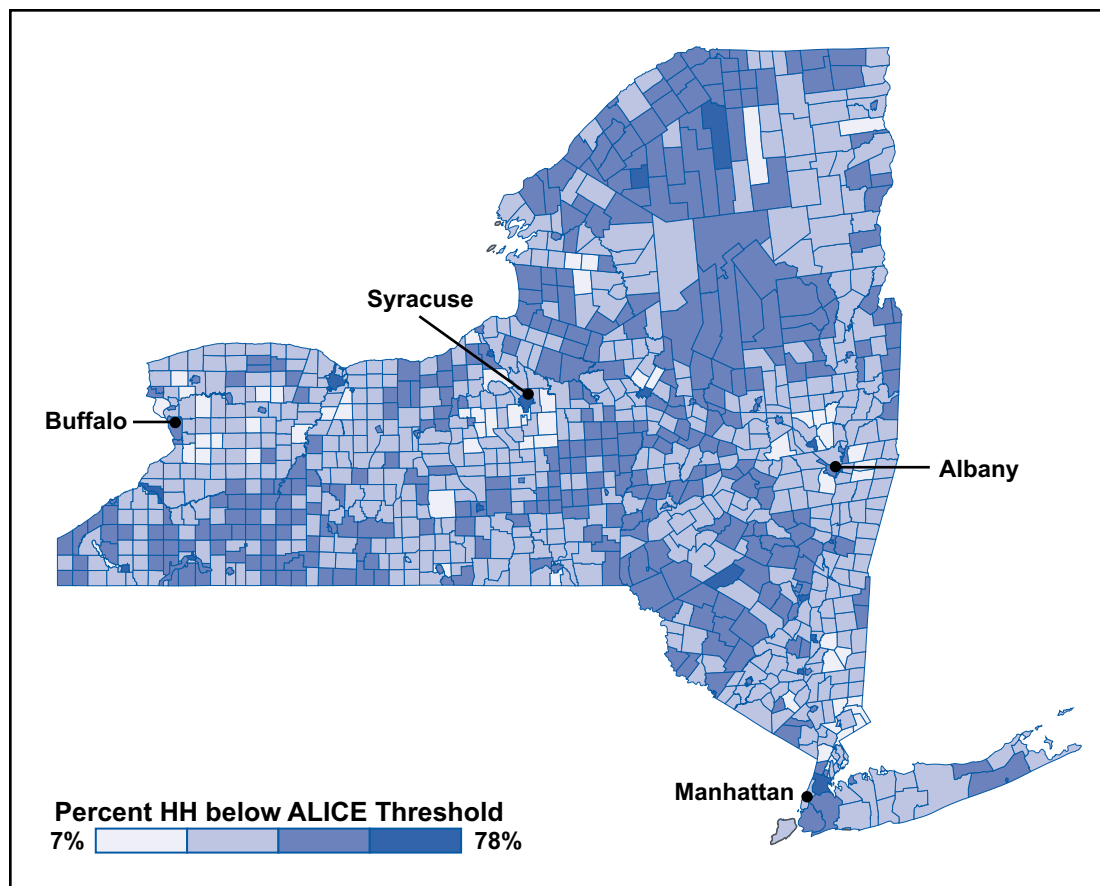

ALICE Breakdown within Counties

ALICE and poverty households live in every area across the state. Because New York has large geographic areas with sparsely populated towns and cities where it can be difficult to get accurate data, the distribution of ALICE and poverty households in the state's towns and cities is shown instead on a map of county subdivisions (Figure 5). County subdivisions include towns and cities as well as their surrounding areas, to provide a more complete view of local variation in household income.

County subdivisions with the lowest percentage of households below the ALICE Threshold are shaded lightest blue on the map in Figure 5; those with the highest percentage are shaded darkest blue. Full data for cities and towns is in Appendix H, and the percent of households below the ALICE Threshold in each municipality is included in the ALICE County Pages (Appendix J).

“ALICE and poverty households live in every area across the state.”

Figure 5.
**Percent of Households below the ALICE Threshold by County Subdivision,
 New York, 2014**

“Only 16 county subdivisions have fewer than 20 percent of households with income below the ALICE Threshold, and most have 30 to 50 percent.”

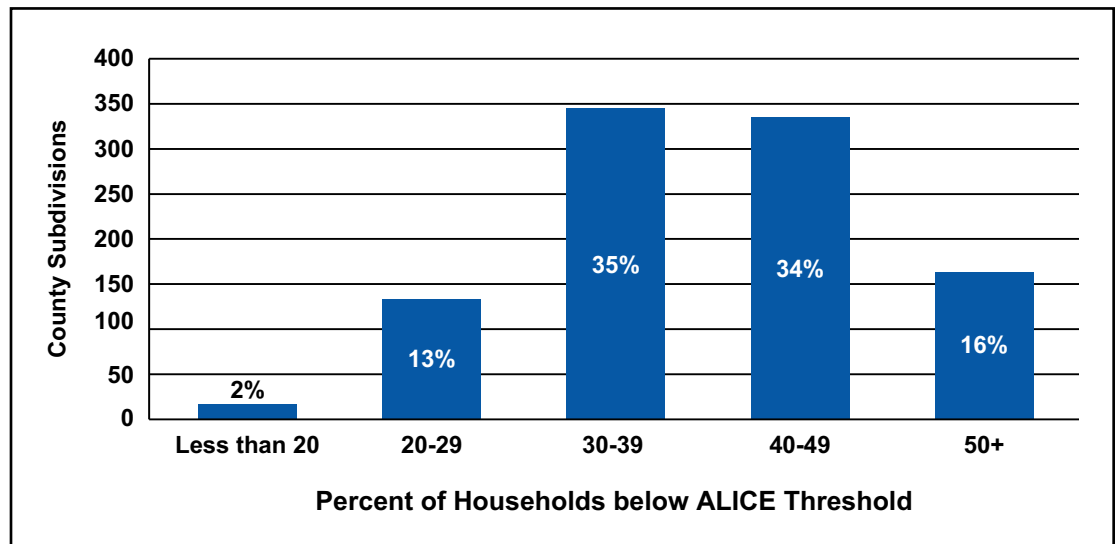

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

Note: For areas with small populations, the American Community Survey estimates of household income are often based on 5-year averages, making these ALICE estimates less precise than the county-level estimates.

Of New York’s 935 county subdivisions, 84 percent have more than 30 percent of households living on an income below the ALICE Threshold. Only 16 county subdivisions have fewer than 20 percent of households with income below the ALICE Threshold, and most have 30 to 50 percent (Figure 6).

“There are 3,760 military households near Fort Drum that are included in the ALICE demographics; of those, 15 percent are in poverty and 51 percent are ALICE.”

Figure 6.
Distribution of Households below the ALICE Threshold across County Subdivisions, New York, 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

Other anomalies exist within counties. There is a large Amish community comprising 75 percent of the population of the city of Leon in Cattaraugus County. This population’s income and housing costs may be different than those outlined in the Household Survival Budget for the modern economy. Of the 352 households in Leon, 22 percent have income below the FPL, and 27 percent are ALICE (American Community Survey, 2014; Watkins and Nichols, 2014; Cattaraugus County Health Department, 2015).

There are also several military bases in New York. Though the ALICE demographics do not include people living in group quarters, such as barracks, those living in housing near military bases are counted. The largest military base in New York is Fort Drum in Jefferson County, with almost 20,000 soldiers. There are 3,760 military households near Fort Drum that are included in the ALICE demographics; of those, 15 percent are in poverty and 51 percent are ALICE (American Community Survey, 2014; Fort Drum, 2016).

Another way to measure the ALICE population is to look at New York’s largest cities as U.S. Census Places (incorporated areas with local governments). Of the 15 cities with more than 20,000 households, all have more than 35 percent of households with income below the ALICE Threshold, and 5 have more than 60 percent: Buffalo, Rochester, Schenectady, Syracuse, and Utica (Figure 7).

Figure 7.

Households below the ALICE Threshold, Largest Cities and Towns in New York, 2014

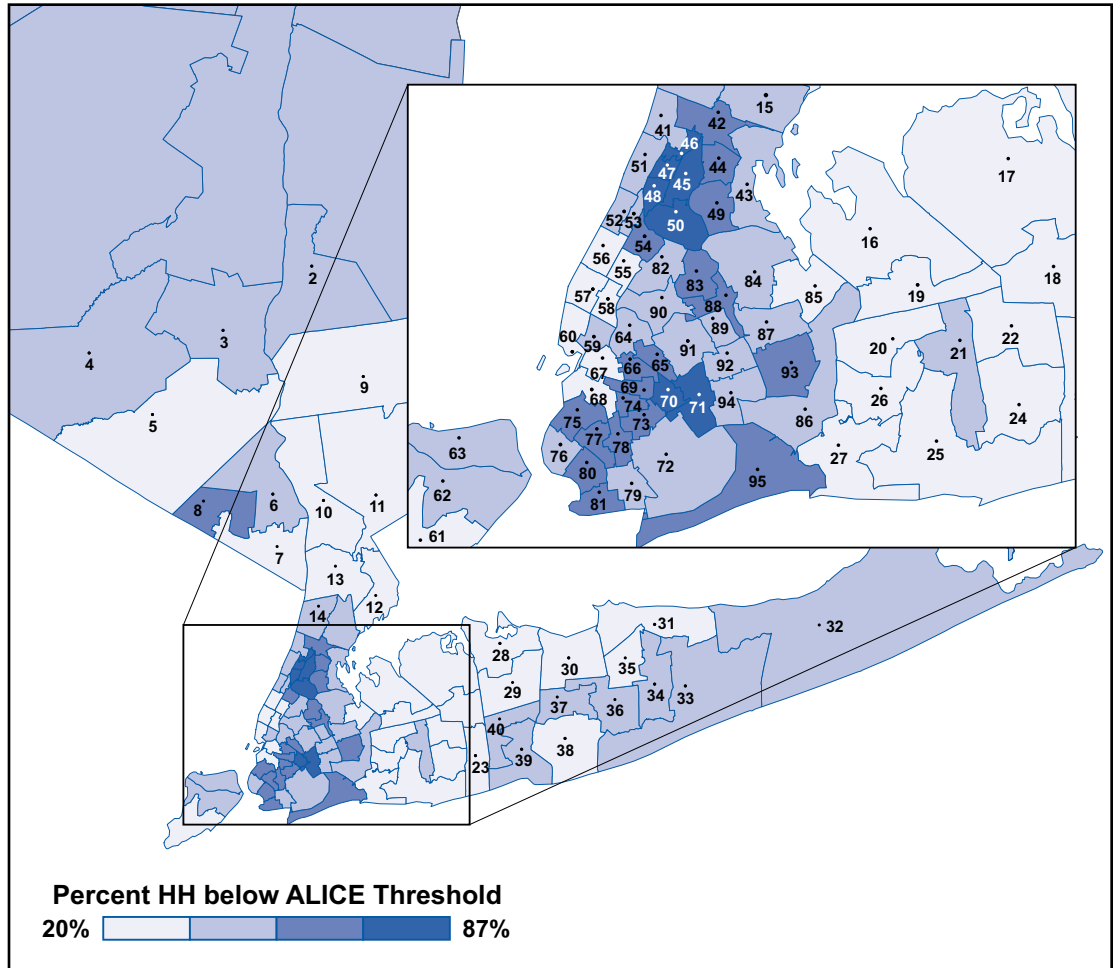

Largest Cities and Towns (above 20,000 Households)	Number of Households	Percent of Households below ALICE Threshold
New York City	3,148,067	52%
Buffalo	110,070	60%
Rochester	83,944	69%
Yonkers	74,187	45%
Syracuse	54,712	60%
Albany	41,262	52%
Cheektowaga	34,471	43%
New Rochelle	27,841	40%
Tonawanda	25,694	35%
Mount Vernon	24,538	55%
Schenectady	24,127	63%
Utica	23,828	61%
Irondequoit	22,315	39%
White Plains	22,033	36%
Niagara Falls	21,300	57%

“The neighborhoods with the highest percentage of households with income below the ALICE Threshold are in the Bronx – Morris Heights, Fordham South, and Mount Hope with 85 percent, and Hunts Point, Longwood, and Melrose with 87 percent.”

Source: U.S. Census “Place”, American Community Survey, 2014, and the ALICE Threshold, 2014

For additional insight into income levels in and near NYC, Public Use Microdata Areas (PUMAs) offer another way to break down large urban areas. PUMAs are non-overlapping areas that partition each state into zones of about 100,000 residents each. PUMA data shows income variation within the 5 boroughs and also between the city and the surrounding counties (Figure 8). The neighborhoods with the highest percentage of households with income below the ALICE Threshold are in the Bronx – Morris Heights, Fordham South, and Mount Hope with 85 percent, and Hunts Point, Longwood, and Melrose with 87 percent. In very close proximity are the areas with the lowest percent – in Manhattan, in the closest counties to the north of the city, and in northern areas of Long Island (American Community Survey, 2014).

“There are young and old ALICE households, those with children, and those with a family member who has a disability. They vary in educational level attained, as well as in race and ethnicity. They live in cities, in suburbs, and in rural areas.”

ALICE DEMOGRAPHICS

ALICE households vary in size and makeup; there is no typical configuration. In fact, contrary to some stereotypes, the composition of ALICE households mirrors that of the general population. There are young and old ALICE households, those with children, and those with a family member who has a disability. They vary in educational level attained, as well as in race and ethnicity. They live in cities, in suburbs, and in rural areas.

These households move above and below the ALICE Threshold over time. For instance, a young ALICE household may capitalize on their education and move above the ALICE Threshold. An older ALICE household may experience a health emergency, lose a job, or suffer a natural disaster and slip into poverty.

While the demographic characteristics of households in poverty as measured by the FPL are well known from U.S. Census reports, the demographic characteristics of ALICE households are not as well known. This section provides an overview of the demographics of New York’s ALICE households and compares them to households in poverty as well as to the total population.

Except for a few notable exceptions, ALICE households generally reflect the demographics of the overall population. Differences are most striking for those groups who traditionally have the lowest wages: women; lesbian, gay, bisexual, and transgender (LGBT) people; people of color; recent immigrants who are undocumented, unskilled, or in limited English-speaking households (all household members 14 years old and over have at least some difficulty with English); people with low levels of education; people with a disability; formerly incarcerated people; and younger veterans. County statistics for race/ethnicity and age are presented in Appendix B.

Age

There are ALICE households in every age bracket in New York (Figure 9). Within each age bracket, the number of ALICE households and households in poverty generally reflects their proportion of the overall state population. Where they differ, the youngest are overrepresented in poverty and the oldest overrepresented in the ALICE population. There are also key differences by region.

Figure 9.

Households below the ALICE Threshold by Age, New York Regions, 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

“Earning enough income to reach the ALICE Threshold is especially challenging for young households in New York, as illustrated by the high numbers of younger households below the ALICE Threshold.”

The youngest New York age group (under 25) is also the smallest, ranging from 1 percent of households in the counties surrounding NYC to 4 percent in the Rest of State. They are the group most likely to be in poverty, and they also have high shares of ALICE households. As the state’s households get older, a smaller percentage of them are in poverty. Middle-aged households (25 to 64 years old) are also the least likely to be ALICE households. Senior households (65 years and older) are less likely to be in poverty but have the highest share of ALICE households.

The exception to these trends is older households in NYC. Instead of poverty rates falling steadily with age, they drop for households headed by someone 24 to 44 years old but then gradually increase again with age, so that 22 percent of senior households in NYC live in poverty and 39 percent are ALICE.

The comparatively low rate of senior households in poverty (14 percent statewide) provides evidence that government benefits, including Social Security, are effective at reducing poverty among seniors (Haskins, 2011). But the fact that 36 percent of senior households qualify as ALICE highlights the reality that these same benefits are often not at a level that enables financial stability. This is especially true in a state like New York where the cost of living is high and many senior households continue to work, some by choice and others because of low income. In New York’s 65- to 74-year-old age group, 27 percent are in the labor force, as are 7 percent of those 75 years of age and over (American Community Survey, 2014).

Earning enough income to reach the ALICE Threshold is especially challenging for young households in New York, as illustrated by the high numbers of younger households below the ALICE Threshold. The same is true in many parts of the country, and the response has typically been a decrease in the number of households headed by someone under the age of 25 as young workers move back in with their parents or find roommates to save money. In fact, from 2007 to 2014, the number of New York’s households headed by someone under 25 decreased by 12 percent (Vespa, Lewis and Kreider, 2013; American Community Survey, 2014).

Race/Ethnicity

The overall racial and ethnic composition of New York households follows the pattern of most of the United States, with White households in the majority in all income categories. By region, White households are in the majority in the Rest of State and the counties surrounding NYC, but NYC, the most diverse city in the nation, has a very different composition (Figure 10).

In the Rest of State, 88 percent of households are headed by someone who is White (White alone, not Hispanic or Latino, U.S. Census classification), as are 85 percent of ALICE households and 75 percent of households in poverty.

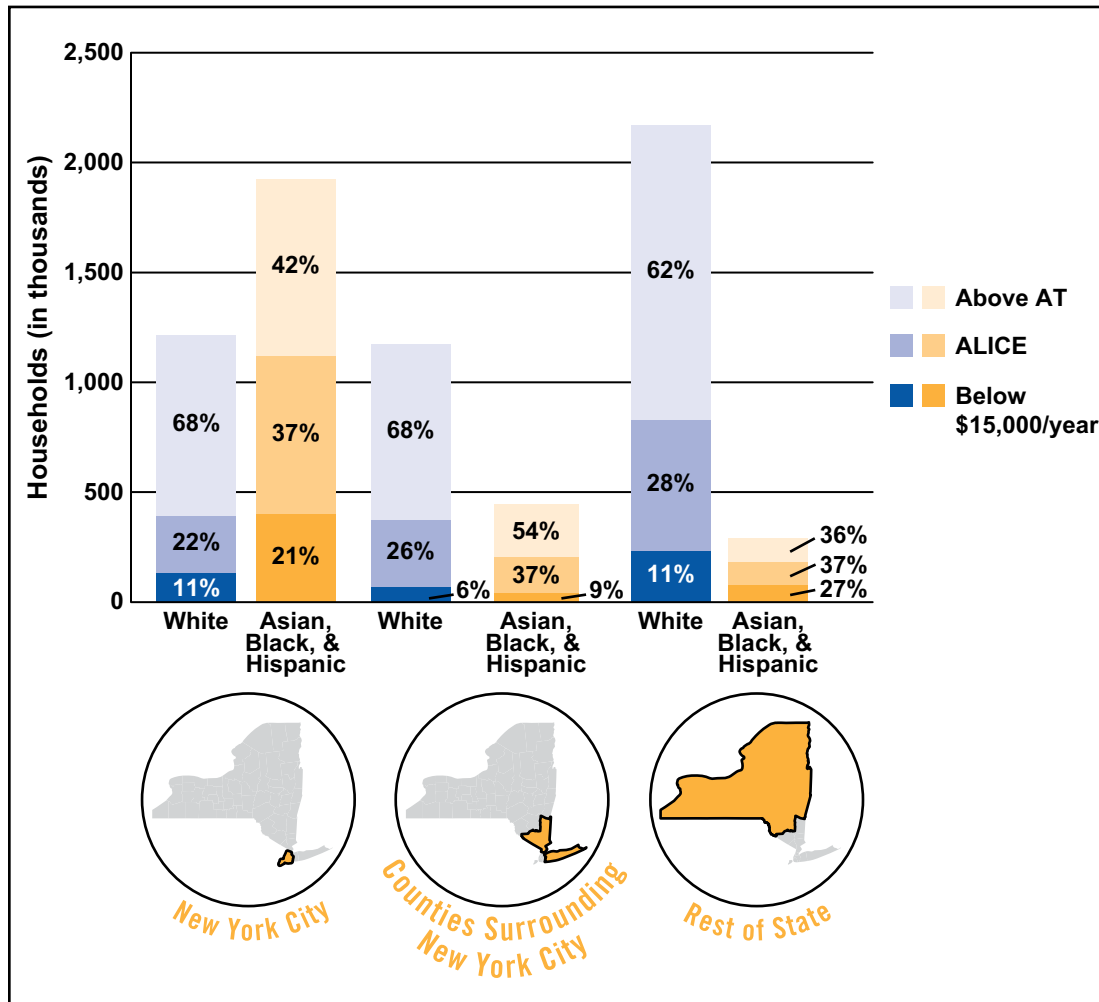

In the counties surrounding NYC, 72 percent of households are headed by someone who is White, as are 65 percent of ALICE households and 64 percent of households in poverty.

In NYC, however, racial and ethnic diversity is much greater and only 39 percent of households are headed by someone who is White (White alone, not Hispanic or Latino, U.S. Census classification), as are 28 percent of ALICE households and 25 percent of households in poverty.

While households of color are over-represented as a percentage of New York’s ALICE and poverty households, overall, the race and ethnicity of ALICE and poverty households fairly closely mirrors that of the state population. The state’s households of color with reported income data – Blacks, Hispanics, and Asians – are shown in greater detail in Figure 11.

Figure 10.

Households by Race/Ethnicity and Income, New York Regions, 2014

“While households of color are over-represented as a percentage of New York’s ALICE and poverty households, overall, the race and ethnicity of ALICE and poverty households fairly closely mirrors that of the state population.”

Note: Because race and ethnicity are overlapping categories and New York is a state with a large percentage of people of color, the totals for each income category do not add up to 100 percent exactly. This data is for households; because household size varies for different racial/ethnic groups, population percentages may differ from household percentages. Native Americans account for only 0.15 percent of households; there is insufficient data to accurately calculate their household income status.

Note: Because household poverty data is not available for the American Community Survey’s Race/Ethnicity categories, annual income below \$15,000 is used as a proxy.

Figure 11.
Hispanic, Black, and Asian Households by Income, New York Regions, 2014

Note: Because household poverty data is not available for the American Community Survey's Race/Ethnicity categories, annual income below \$15,000 is used as a proxy.

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

New York is one of the most diverse states in the country, with people of color accounting for 37 percent of all households. However, the size of the population of color varies greatly between neighborhoods, counties, and regions of New York. According to a Penn State University study, the New York City metropolitan statistical area was the fifth most diverse metro area in the country in 2010, while the Glens Falls metro area in Warren County was the fourth least diverse (Lee, Iceland, & Sharp, 2012).

The first White residents of present-day New York were the Dutch, who settled in Albany and New Amsterdam (now New York City). As early as 1698, two-thirds of the 18,000 residents of what would become New York State lived in or around present-day New York City, and more than 18 languages were spoken (Glaeser, 2005). The Dutch were quickly followed by German, English, and Scottish immigrants; today, the state's White population includes Italian, Irish, Polish, and many other European ethnicities. In addition, residents of any race can also be ethnically Hispanic, and 9 percent of the White population in New York identifies as Hispanic (American Community Survey, 2014; Pew Research Center, 2014).

Hispanics surpassed Blacks in 2003 to become New York's largest population of color, accounting for 15 percent of the total population and ranging from less than 1.5 percent in Hamilton, Lewis, Allegany, Tioga, Schuyler, and Steuben counties to 58 percent in Bronx County. New York has the fourth-largest Hispanic population in the country and the ninth-largest proportion of Hispanic people, but 93 percent of the Hispanic population lives in NYC and its surrounding counties; only 3.2 percent of the Rest of State is Hispanic (American Community Survey, 2014).

Hispanics first immigrated in 1859, when cigar factories brought Cuban migrants to NYC. Puerto Ricans and Dominicans came to New York in large numbers after World War II, followed by another influx of Cuban migrants during the 1959-1962 Cuban revolution. Mexicans only started immigrating to New York in large numbers in the 1990s. Immigration continues for all of these groups, and increased in the 2000s. Today, 62 percent of the state's Hispanic residents are native-born. Of those who are foreign-born, the largest share – 13 percent – are from Mexico, followed by immigrants from Puerto Rico, Ecuador, Colombia, and El Salvador (Migration Policy Institute, 2014; PBS, 2013; Kelley, 2015; Badillo, 2009).

Black households are the second-largest population of color, accounting for just under 15 percent of the state's total population. The proportion of Black households ranges from 6.6 percent in the Rest of State to 32 percent in Kings (Brooklyn) County.

Blacks entered New York in waves, initially brought as slaves until the state abolished slavery in 1827. The Great Migration of Blacks from southern states to northern and western cities led to a doubling of New York's black population roughly every two decades between 1910 and 1970. More recent increases have come from migration of foreign-born Blacks, changing the composition of a population that had been primarily African-American. Foreign-born Blacks made up 28 percent of the overall Black population of the NYC metropolitan statistical area in 2013 (American Community Survey, 2014; McCabe, 2011; Gibson and Jung, 2002; Gambino, Trevelyan, and Fitzwater, 2014).

Asian households make up 9 percent of New York's total population, but the size of the Asian population varies greatly between regions and counties, from 2 percent in the Rest of State to 12 percent in NYC and up to 24 percent in Queens County. Asians are the fastest-growing group in New York, accounting for 87 percent of the growth in the state's population between 2000 and 2014. Until 1965, few Asians were able to migrate to the U.S., but following the Immigration and Nationality Act, waves of immigrants came to New York from China, India, the Philippines, and Korea, with more recent growth in populations from Burma (or Myanmar), Bangladesh, and Pakistan. New York's Asian population is now aging, with the

“New York is one of the most diverse states in the country, with people of color accounting for 37 percent of all households.”

“While ALICE households come in all sizes and demographic configurations, two of the most common types are seniors and households with children.”

number of those over 65 having tripled since 2000. In some low-income areas like Flushing, Chinatown, and Bayside in NYC that are dominated by immigrants, Asians make up more than 40 percent of the population (American Community Survey, 2014; DiNapoli, 2016).

Native Americans had lived in what is now New York for millennia before the arrival of Europeans, and the original five tribes of the Iroquois Confederacy formed a democracy that predated the U.S. Constitution. Over time they were moved to reservations, and then encouraged to assimilate and move to cities. Today, only 0.15 percent of New Yorkers are Native American, and fewer live on reservations. Most New Yorkers who identify as Native American live in western New York, where the 8,000-member Seneca Nation of Indians is the region’s fifth-largest employer. In Central New York, the 1,000-member Oneida Indian Nation is the region’s single largest employer (Independence Hall Association, 2016; American Community Survey, 2014; Watkins and Nichols, 2014; New York State Education Department, 2013; New York University, 2012; Cattaraugus County Health Department, 2015).

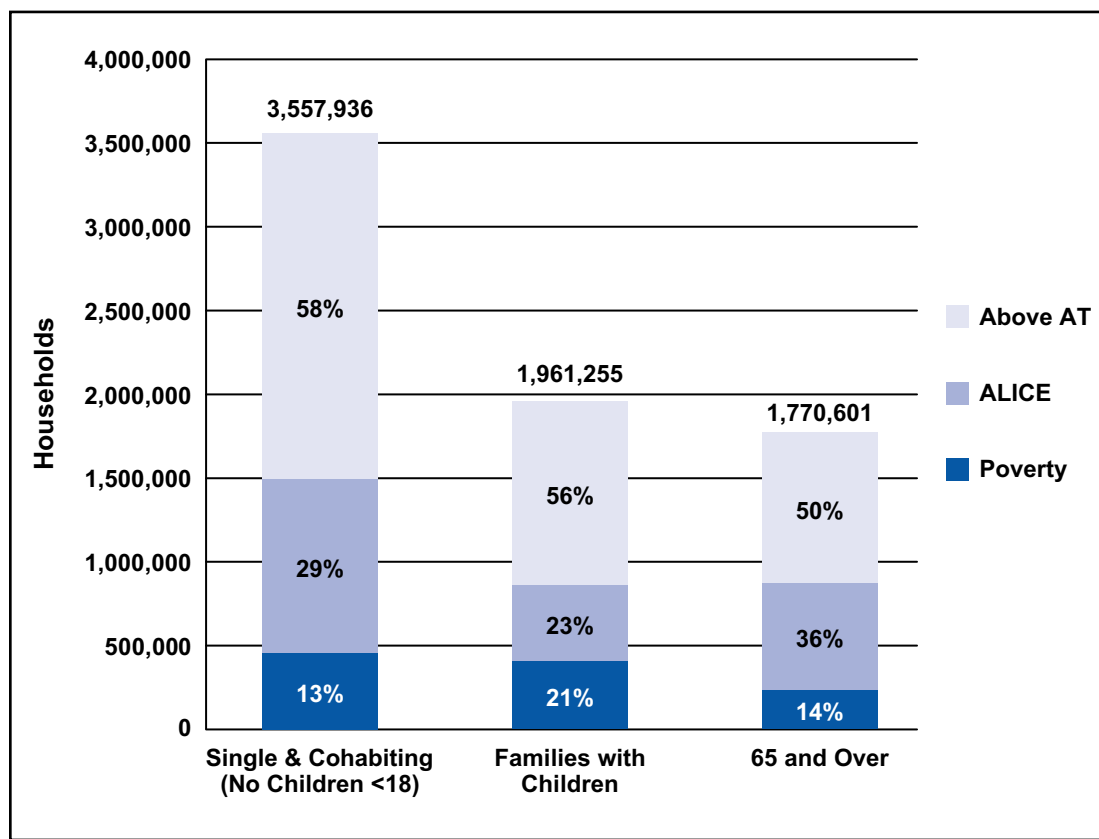

People of Some Other Race (Census classification) account for 2.7 percent of the New York population; those who identify as Two or More Races represent 0.7 percent (American Community Survey, 2014).

Household Type

While ALICE households come in all sizes and demographic configurations, two of the most common types are seniors and households with children. Yet in a reflection of changing family structures across the country, there are now many more types of households as well, and these “other” households now make up the largest share of households with income below the ALICE Threshold in New York, at 46 percent. These households include families with at least two members related by birth, marriage, or adoption, but with no children under the age of 18; single adults younger than 65; or people who share a housing unit with non-relatives – for example, boarders or roommates. Across the country, these households – single or cohabiting, without children under 18 – increased between 1970 and 2012: The share of households made up of married couples with children under 18 decreased by half, from 40 percent to 20 percent, while the proportion of single-adult households increased from 17 percent to 27 percent (Vespa, Lewis, and Kreider, 2013).

After these single or cohabiting households, seniors (27 percent) and families with children (27 percent) still make up significant numbers of New York households below the ALICE Threshold (Figure 12). This is not surprising as these demographics are associated with higher costs, especially in health care for seniors and child care for families with children. Senior ALICE households were discussed earlier in this section; ALICE families with children are examined further below.

Figure 12.
Household Types by Income, New York, 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

By region, the income levels of single or cohabiting households do not vary as greatly as do other household types. Following the pattern of overall households by region, single or cohabiting households are less likely to be in poverty in the counties surrounding NYC, but only slightly more likely in NYC and the Rest of State. In addition, the percent of single or cohabiting ALICE households remains similar across regions, ranging from 26 to 28 percent.

Families with Children

The economic status of America's families with children under the age of 18 has declined since 2007. Of New York's 1.96 million families with children, 44 percent (864,499) have income below the ALICE Threshold. While married-parent families with children far outnumber single-parent families, a higher proportion of children in single-parent families live below the ALICE Threshold. Family make-up differs greatly by region, with far more single-parent families in NYC than in the Rest of State, but the proportions in poverty and ALICE remain fairly constant across the regions (Figure 13). Because discussions of low-income families often focus on single parents, it is important to note that the lines between married-couple and single-parent households are often blurred. Nationally, only 37 percent of single-parent homes have one parent as the sole adult in the household. In 11 percent of "single-parent" homes, the parent has a cohabiting partner; in 52 percent, another adult age 18 or older lives in the home (Vespa, Lewis, and Kreider, 2013).

"Because discussions of low-income families often focus on single parents, it is important to note that the lines between married-couple and single-parent households are often blurred."

Figure 13.
Families with Children by Income, New York Regions, 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

Not surprisingly, the most expensive household budget is for a household with young children, due not only to these households' larger size but also to the cost of child care, preschool, and after-school care (discussed further in Section II). The biggest factors determining the economic stability of a household with children are the number of wage earners, the gender of the wage earners, the number of children, and the cost of child care for children of different ages.

Married-Couple Families with Children

With two income earners, married couples with children have greater means to provide a higher household income than households with one adult. For this reason, 72 percent of married-couple families with children in New York have income above the ALICE Threshold. However, because they are such a large demographic group, married-couple families with children still account for 31 percent of families with children who live in poverty and 51 percent of ALICE families with children.

By region, married couples with children are more likely to struggle financially in NYC, where 16 percent are in poverty and 23 percent are ALICE, compared to the Rest of State, where 7 percent are in poverty and 13 percent are ALICE, or the counties surrounding NYC, where 6 percent are in poverty and 17 percent are ALICE.

Nationally, married-couple families experienced a 33 percent increase in unemployment for at least one parent during the Great Recession. A subset of this group, families who owned their own homes, faced an even greater challenge: Between 2005 and 2011, the number of households with children (under 18) that owned a home fell by 15 percent (Vespa, Lewis, and Kreider, 2013).

Single Female-Headed Families with Children

Families headed by single women with children account for 27 percent of all New York families with children but 48 percent of the state's households with children below the ALICE Threshold. They are much more likely to struggle financially, making up 60 percent of the state's families with children in poverty and 37 percent of families with children who are ALICE.

Regionally, single female-headed families are more prevalent in NYC, accounting for 33 percent of all families with children there compared to only 16 percent of families in the counties surrounding NYC and 28 percent in the Rest of State. They are more likely than other families to struggle financially in all three regions: Half are in poverty in NYC and in the Rest of State, as are 31 percent in the counties surrounding NYC. And they are even more likely to be ALICE in those surrounding counties (42 percent), with more average rates in NYC (30 percent) and the Rest of State (31 percent).

Single female-headed families are often highlighted as the most typical low-income household. With only one wage earner, it is not surprising that single-parent families are over-represented among ALICE households. For women, this is compounded by the fact that in New York, they still earn significantly less than men, as detailed below in Figure 15. Yet it is important to note that in New York, single female-headed families account for only 12 percent of all households below the ALICE Threshold and 18 percent of all working-age households below the ALICE Threshold. Many other types of households also struggle to afford basic necessities.

Using a different calculation, the Working Poor Families Project (WFPF) estimated that in 2012, 42 percent of low-income working families in New York were headed by women, as were 39 percent nationally. However, the WFPF population of households is much smaller because it does not include households with unemployed workers or those with a disability (as the ALICE Threshold does), which may overstate the prominence of single female-headed families (Rudowitz, Artiga, and Arguello, 2014).

“Not surprisingly, the most expensive household budget is for a household with young children, due not only to these households’ larger size but also to the cost of child care, preschool, and after-school care.”

Single Male-Headed Families with Children

The number of households headed by single men with children is a growing group in New York and across the country. While most single-parent families are still headed by mothers, single-father families account for 8 percent of all New York families with children and 11 percent of families with income below the ALICE Threshold. Although they are less common than single female-headed families, single male-headed families face similar challenges, with only one wage earner responsible for child care. In fact, when looking at parent types by income tier in New York, 64 percent of all single-male-headed families with children have income below the ALICE Threshold.

“The persistence of the gender wage gap helps explain why female-headed households are disproportionately likely to live in poverty or to be ALICE.”

ADDITIONAL RISK FACTORS FOR BEING ALICE

Demographic groups that are especially vulnerable to underemployment, unemployment, and lower earning power are more likely than other groups to be in poverty or to be ALICE. In addition to the challenges faced by people of color discussed earlier in this section, four other demographic factors make a household more likely to fall into the ALICE population: being female, being LGBT, having low levels of education, and living with a disability. Groups with more than one of these factors – such as younger combat veterans, formerly incarcerated people, or undocumented, unskilled, or limited English-speaking recent immigrants – are even more likely to fall below the ALICE Threshold.

Women

Although women make up nearly half of the U.S. workforce, receive more college and graduate degrees than men, and are the equal or primary breadwinner in four out of ten families, they continue to earn significantly less than men in comparable jobs.

According to the BLS Current Population Survey, women’s median earnings are lower than men’s in nearly all occupations. In 2014, female full-time workers still made only 78 cents on each dollar earned by men, a gap of 22 percent. In addition, male-dominated occupations tend to pay more than female-dominated occupations at similar skill levels. Despite many changes to the economy, these disparities remain persistent features of the U.S. labor market (Bureau of Labor Statistics, 2015; Hegewisch and Ellis, 2015). The persistence of the gender wage gap helps explain why female-headed households are disproportionately likely to live in poverty or to be ALICE.

Older women are also more likely to be poor: Recent data reveals that nationally, among people aged 65 and older, 64 percent more women than men are poor (Hess and Román, 2016). In New York, senior women are more likely to live longer and to be in poverty. Of those 65 years and older, there were 24 percent more women than men in 2014, yet 50 percent more women than men were in poverty – 11 percent of women compared to 8 percent of men (American Community Survey, 2014).

People with Lower Levels of Education

Income continues to be highly correlated with education. In New York, 27 percent of the population 25 years and older have only a high school diploma, and 25 percent have some college education or an associate’s degree, but only 20 percent have a bachelor’s degree and 15 percent have a graduate or professional degree, despite the fact that median earnings increase significantly for those with higher levels of education (Figure 14).

Figure 14.

Education Attainment and Median Annual Earnings, New York, 2014

Source: American Community Survey, 2014

Those residents with the least education are more likely to have earnings below the ALICE Threshold. Yet with the increasing cost of education over the last decade, college has become unaffordable for many and a huge source of debt for others. Despite the fact that New York colleges and universities received more than \$386 million in federal Pell Grants in 2014, 61 percent of New York's Class of 2014 still graduated with an average of \$27,822 in student debt (National Priorities Project, 2015; Project on Student Debt, 2015).

ALICE households are more likely to have less education than households above the ALICE Threshold, but higher education alone is no longer a reliable predictor of a self-sufficient income. Many demographic factors impact a household's ability to meet the ALICE Threshold. For example, according to the National Center for Education Statistics, economically disadvantaged students, students with limited English proficiency, and students with disabilities all have graduation rates below the state and national averages for all students. In New York in 2013, the public high school graduation rate was 77 percent for all students but significantly lower for economically disadvantaged students (68 percent), those with disabilities (48 percent), and those with limited English proficiency (44 percent) (Stetser and Stillwell, 2014). It is not surprising that these same groups also earn lower wages later in life.

Within New York and across all states, there is also a striking difference in earnings between men and women at all educational levels (Figure 15). **Men in New York earn at least 19 percent more than women across all educational levels and as much as 42 percent more for those with less than a high school diploma** (American Community Survey, 2014). This, in part, helps explain why so many of New York's single female-headed households have incomes below the ALICE Threshold.

“ALICE households are more likely to have less education than households above the ALICE Threshold, but higher education alone is no longer a reliable predictor of a self-sufficient income.”

“The national median income for households where one adult is living with a disability is generally 60 percent less than for those without disabilities.”

Figure 15.
Median Annual Earnings by Education and Gender, New York, 2014

Source: American Community Survey, 2014

People with a Disability

Households with a member who is living with a disability are more likely than other households to be in poverty or to be ALICE. These households often have both increased health care expenses and reduced earning power. The national median income for households where one adult is living with a disability is generally 60 percent less than for those without disabilities (American Community Survey, 2006 and 2013).

The National Bureau of Economic Research estimates that 36 percent of Americans under age 50 have been disabled at least temporarily, and 9 percent have a chronic and severe disability. The economic consequences of disability are profound: 79 percent of Americans with a disability experience a decline in earnings, 35 percent have lower after-tax income, and 24 percent have a lower housing value. The economic hardship experienced by the chronically and severely disabled is often more than twice as great as that of the average household (Meyer and Mok, 2013). In addition, those with a disability are more likely to live in severely substandard conditions and pay more than one-half of their household income for rent (U.S. Department of Housing and Urban Development (HUD), March 2011).

New York's numbers fit with these national findings. Notably, New York residents with a disability are far less likely to be employed: Only 21 percent of working-age residents (18–64 years old) with a disability are employed, compared to 59 percent of those with no disability. And for those who are working, they earn less. The median annual earnings for a New York resident with a disability are \$22,957, compared to \$34,441 for a worker without a disability (American Community Survey, 2014).

A total of 2,020,411 adults in New York have a lasting physical, mental, or emotional disability that impedes them from being independent or able to work. Approximately 24 percent of New York residents aged 16 and over with a severe disability live in poverty, compared with 14.3 percent of all residents in that age group. Disability is generally disproportionately associated with age; in New York, 35 percent of residents 65 years or older are living with a disability, more than double the 13 percent average for all ages (American Community Survey, 2014).

The LGBT Community

According to Gallup surveys conducted in 2012, the percentage of New York adults who identify as lesbian, gay, bisexual, or transgender (LGBT) is 3.8 percent, slightly above the nationwide average of 3.5 percent (Gates and Newport, 2013). Though there is less data available about LGBT workers, they are likely to be economically disadvantaged. Despite having more education than the general population, LGBT workers often earn less than their heterosexual counterparts, experience greater unemployment, and are more likely to live in extreme poverty (earning \$10,000 annually or less) (Harrison, Grant and Herman, 2012; Burns, 2013; Harris, 2015).

Most same-sex households live in cities in New York, but conditions vary across the state. According to the Human Rights Campaign's Municipal Equality Index, NYC, Rochester, and Yonkers earned the highest scores (100 out of 100) on measures of inclusivity for LGBT residents and workers, and Albany, Syracuse, and Buffalo were also high scorers (92 out of 100), while smaller cities such as Brookhaven and Northwest Harbor earned much lower scores (44 and 62 respectively) (Human Rights Campaign, 2015).

Undocumented, Unskilled, and Limited English-Speaking Recent Immigrants

Related to race and ethnicity is immigration, with Hispanics, Asians, and Africans making up the majority of New York's 4,465,415 immigrants. In terms of place of birth, 49 percent of the state's immigrants were born in Latin America; 28.3 percent were born in Asia; 16.5 were born in Europe; and 4.3 were born in Africa (Migration Policy Institute, 2013; Maciag, 2014).

Immigrant groups vary widely in language, education, age, and skills. **Nationally, immigrants are only slightly more likely to be in poverty or to be ALICE than non-immigrants. However, for some subsets of immigrant groups – such as non-citizens; more recent, less-skilled, or unskilled immigrants; and those who are in limited English-speaking households (where no one in the household age 14 or older speaks English only or speaks English “very well”) – the likelihood increases** (Suro, Wilson and Singer, 2012; American Community Survey, 2014).

Refugees make up a small subset of immigrants to New York. Since 1980, 3,000 to 5,000 refugees per year have resettled in the state. Of the 4,085 who resettled in 2014, half were from Burma and Bhutan, one-quarter were from the Democratic Republic of Congo and Somalia, and the rest were from Iraq and Afghanistan. The proportion of refugees resettling in the Rest of State has grown over time from 76 percent in 2006 to 96 percent in 2014, with particularly high resettlement in the greater Buffalo, Rochester, and Utica areas in 2014. These immigrants face a unique set of challenges in reaching financial stability, including poor health from previous inadequate medical care, exposure to torture or terrorism, as well as poverty, and language barriers (New York Bureau of Refugee and Immigrant Assistance (BRIA), 2015; NYS Health Foundation, 2016).

Recent immigrants in general earn less than longer-term residents. The median annual income for foreign-born New York residents who entered the state since 2010 is \$42,079, while the median income for foreign-born residents who came to New York before 2000 is \$51,813.

In terms of education attainment, foreign-born residents living in New York are less likely than residents born in New York to graduate from high school (74 percent compared to 81 percent for residents born in-state). Yet in college, they achieve at almost the same rate as residents born in-state (17 percent have a bachelor's degree, compared to 19 percent for those born in-state), and they receive almost as many graduate degrees (12 percent, compared to 15 percent for residents born in-state) (American Community Survey, 2014).

“Immigrant groups vary widely in language, education, age, and skills. Nationally, immigrants are only slightly more likely to be in poverty or to be ALICE than non-immigrants.”

“Unemployed veterans are most at risk of being in poverty or living in ALICE households, especially when they have exhausted their temporary health benefits and unemployment benefits.”

Across income and educational levels, the data on immigrants reinforces the point that ALICE households are working and are an essential part of the economy. Immigrant-owned businesses contributed at least \$229 billion to the New York economy in 2014. Immigrants comprised 23 percent of the state’s population and 27 percent of the state’s workforce in 2013 (American Immigration Council, 2015).

However, some immigrant groups face language and citizenship barriers that keep them from jobs, higher wages, and resources (Suro, Wilson and Singer, 2012). The Pew Research Center estimates that there were 750,000 unauthorized immigrants in New York, or roughly 4 percent of the state’s population, in 2012. Elementary and secondary students with an unauthorized immigrant parent account for 5.5 percent of school children, and unauthorized adult immigrants account for 6 percent of the state’s workforce (Passel, Cohn, and Rohai, 2014). This group of immigrants is often paid off the books; they are not formally recognized and therefore have few or no labor protections (such as minimum wage or safety regulations) and little or no access to the public safety net (discussed further in the Conclusion).

According to a report by the Congressional Budget Office (CBO), in general, state and local governments carry most of the cost of providing a range of public services to unauthorized immigrants – particularly services related to education, health care, and law enforcement. Because these governments provide these services to all residents in their jurisdiction, the amount spent on services to unauthorized immigrants represents a small percentage of the total. The tax revenues that unauthorized immigrants generate for state and local governments, however, do not offset the total cost of services that they receive, and federal aid programs do not fully cover the costs that state and local governments incur (Merrell, 2007).

Research by the U.S. Census Bureau has found that English-speaking ability among immigrants influences their employment status, ability to find full-time employment, and earning levels, regardless of the particular language spoken at home. Those with the highest level of spoken English have the highest earnings, which approach the earnings of English-only speakers (Day and Shin, 2005). The American Community Survey reports more than 158 different foreign languages spoken in New York, with Spanish being the most common at 6 percent. Of New York households, 8 percent are limited English-speaking households (American Community Survey, 2010 and 2014).

Veterans

As of 2014, there were 773,063 veterans living in New York. Unemployed veterans are most at risk of being in poverty or living in ALICE households, especially when they have exhausted their temporary health benefits and unemployment benefits. Younger veterans, in particular, embody a trifecta of factors that make them more likely to be ALICE: They are dealing with the complex physical, social, and emotional consequences of military service; they are more likely to have less education and training than veterans of other service periods; and they are more likely to have a disability than older veterans.

Unemployment is a major challenge for younger veterans. Seventy-four percent of New York’s veterans are in the labor force (including those looking for work); of those, 6.6 percent were unemployed in 2014. But while 93 percent of New York veterans are 35 years or older (Figure 16), **the most recent and youngest – 51,022 veterans aged 18 to 34 years – are most likely to be unemployed or in struggling ALICE households.** While state-level data is not available, at the national level, veterans aged 18-34 years are twice as likely as their older counterparts to be unemployed. Within the young age group, the very youngest – those aged 18 to 24 years – are the most likely to be unemployed, with 16 percent unemployed in 2014 (American Community Survey, 2014; Bureau of Labor Statistics, 2014).

There were 2,399 homeless New York veterans in 2014, down 59 percent from 5,879 in 2011 (American Community Survey, 2014; HUD, October 2014; HUD, November 2015).

Figure 16.

Veterans by Age, New York, 2014

Age	Number of Veterans (New York)	Percent of Total Veterans (New York)	Percent of Veterans Unemployed (U.S.)
18 to 34 years	51,022	7%	9%
35 to 54 years	154,613	20%	5%
55 to 64 years	129,875	17%	5%
65 years and over	437,553	57%	4%

Source: American Community Survey, 2014; Bureau of Labor Statistics, 2014

The root causes of higher unemployment of veterans from recent deployments are uncertain, but a report from the Federal Reserve Bank of Chicago suggests a number of possibilities. First, wartime deployments often result in physical or psychological trauma that affects the ability of new veterans to find work. Second, deployed veterans receive combat-specific training that is often not transferable to the civilian labor market. Finally, new veterans are typically younger and less educated than average workers – two factors that predispose job-seekers to higher unemployment rates (Faberman and Foster, 2013; Bureau of Labor Statistics, 2015).

“People with past convictions in New York and across the country are more likely to be unemployed or to work in low-wage jobs.”

Ex-Offenders

New York’s incarceration rate of 265 per 100,000 adults is below the national average of 392 per 100,000 adults (National Institute of Corrections, 2014). However, the incarceration rate for Black working-age men in New York was 5.3 percent in 2010 – almost double the national average of 3 percent (Pawasarat and Quinn, 2013; National Institute of Corrections, 2014; The Sentencing Project, 2007).

People with past convictions in New York and across the country are more likely to be unemployed or to work in low-wage jobs. Research has documented that ex-offenders are confronted by an array of barriers that significantly impede their ability to find work and otherwise reintegrate into their communities, including low levels of education, lack of skills and experience due to time out of the labor force, employer reluctance to hire ex-offenders, questions about past convictions on initial job applications, problems obtaining subsidized housing, and substance abuse issues.

A range of studies has found that ex-offenders have employment rates between 9.7 and 23 percent lower than those of non-offenders; in 2008, those reductions lowered the total male employment rate in the U.S. by 1.5 to 1.7 percentage points. When ex-offenders do find employment, it tends to be in low-wage service jobs often held by ALICE workers, in industries including construction, food service, hotel/hospitality, landscaping/lawn care, manufacturing, telemarketing, temporary employment, and warehousing (Leshnick, Geckeler, Wiegand, Nicholson, and Foley, 2012; Schmitt and Warner, 2010).

II. HOW COSTLY IS IT TO LIVE IN NEW YORK?

Measure 2 – The Household Budget: Survival vs. Stability

AT-A-GLANCE: SECTION II

The Household Survival Budget

- The Household Survival Budget estimates the minimum required for each of the five basic household necessities needed to live and work in the modern economy: housing, child care, food, transportation, and health care.
- The average annual Household Survival Budget for a four-person family living in New York is \$62,472 – more than double the U.S. poverty level of \$23,850 per year for the same size family.
- The Household Survival Budget for a family translates to an hourly wage of \$31.24 for one parent (or \$15.62 per hour each, if two parents work).
- The average annual Household Survival Budget for a single adult in New York is \$21,540, which translates to an hourly wage of \$10.77.
- Child care represents a New York family's greatest expense at \$1,363 for registered home-based care. (Licensed and accredited child care, used in the Household Stability Budget, is even more expensive at an average of \$1,755 per month for two children.)

The Household Stability Budget

- The Household Stability Budget measures how much income is needed to support and sustain an economically viable household, including both a 10 percent savings plan and the cost of a smartphone.
- The average annual Household Stability Budget is \$116,268 for a family of four, nearly double the Household Survival Budget.
- To afford the Household Stability Budget for a two-parent family, each parent must earn \$29.07 per hour or one parent must earn \$58.14 per hour.

“The cost of basic household necessities increased in New York from 2007 to 2014, despite low inflation during the Great Recession.”

The cost of basic household necessities increased in New York from 2007 to 2014, despite low inflation during the Great Recession. As a result, 44 percent of households in New York are challenged to afford the basic necessities. This section presents the **Household Survival Budget**, a realistic measure estimating what it costs to afford the five basic household necessities: housing, child care, food, transportation, and health care.

THE HOUSEHOLD SURVIVAL BUDGET

The Household Survival Budget follows the original intent of the Federal Poverty Level (FPL) as a standard for temporary sustainability (Blank, 2008). This budget identifies the minimum cost option for each of the five basic household items needed to live and work in today's economy. Figure 17 shows a statewide average Household Survival Budget for New York in two variations, one for a single adult and the other for a family with two adults, a preschooler, and an infant. A Household Survival Budget for each county in New York is presented in Appendix J, and additional family variations are available at: <http://spaa.newark.rutgers.edu/united-way-alice>.

The average annual Household Survival Budget for a four-person family living in New York is \$62,472, an increase of 19 percent from the start of the Great Recession in 2007. That increase was driven primarily by a 56 percent increase in the cost of health care and a 20 percent increase in the cost of food. The rate of inflation over the same period was 14 percent.

The Household Survival Budget for a family translates to an hourly wage of \$31.24, 40 hours per week for 50 weeks per year for one parent (or \$15.62 per hour each, if two parents work).

The annual Household Survival Budget for a single adult is \$21,540, an increase of 16 percent since 2007. The single-adult budget translates to an hourly wage of \$10.77.

As a frame of reference, it is worth noting that the Household Survival Budget is lower than most current measures, including the MIT Living Wage Calculator, the Economic Policy Institute's Family Budget Calculator, and the Center for Women's Welfare's Self-Sufficiency Standard (MIT, 2015; Economic Policy Institute, 2015; Pearce, 2014). These are compared with both the Household Survival and Household Stability budgets later in this section.

“The average annual Household Survival Budget for a four-person family living in New York is \$62,472, an increase of 19 percent from the start of the Great Recession in 2007.”

Figure 17.
Household Survival Budget, New York Average, 2014

New York Average – 2014			
	SINGLE ADULT	2 ADULTS, 1 INFANT, 1 PRESCHOOLER	2007 – 2014 PERCENT CHANGE
Monthly Costs			
Housing	\$668	\$919	17%
Child Care	\$-	\$1,363	9%
Food	\$202	\$612	20%
Transportation	\$330	\$653	11%
Health Care	\$141	\$564	56%
Miscellaneous	\$163	\$473	19%
Taxes	\$291	\$622	35%
Monthly Total	\$1,795	\$5,206	19%
ANNUAL TOTAL	\$21,540	\$62,472	19%
Hourly Wage	\$10.77	\$31.24	19%

Source: See Appendix C

“To put these costs in national context, the National Low Income Housing Coalition (NLIHC) reports that New York was the fourth most expensive state in the country for housing in 2014.”

In comparison to the annual Household Survival Budget, the U.S. poverty level was \$23,850 per year for a family of four and \$11,670 per year for a single adult in 2014. In that same year, the New York median family income was \$71,115 per year, and the median household income was \$58,878.

Increases in budget costs occurred primarily from 2007 to 2010 but continued through 2014. The 17 percent increase in housing is particularly surprising because it happened during a downturn in the housing market and was higher than the 14 percent national rate of inflation. However, it is understandable when seen against the backdrop of the foreclosure crisis that occurred at the top and middle of the housing market during the Great Recession. As foreclosed homeowners moved into lower-end housing, there was increased demand for an already limited housing supply, and housing prices rose accordingly.

The Household Survival Budget varies across New York counties. The basic essentials are least expensive in Allegany, Chautauqua, and Chenango counties for a family at \$55,944, and in Wyoming County for a single adult at \$18,216. They are most expensive in Suffolk County both for a family at \$90,324 and for a single adult at \$28,176. For each county’s Survival Budget, see Appendix J.

Housing

The cost of housing for the Household Survival Budget is based on the U.S. Department of Housing and Urban Development’s (HUD) Fair Market Rent (FMR) for an efficiency apartment for a single adult and a two-bedroom apartment for a family. The cost includes utilities but not telephone service, and it does not include a security deposit.

Housing costs vary by county in New York. Rental housing is least expensive for a two-bedroom apartment in Allegany, Chautauqua, and Chenango counties at \$637 per month and for an efficiency apartment in Wyoming County at \$445. Rental housing is most expensive for a two-bedroom apartment in Nassau and Suffolk counties at \$1,613 per month and for an efficiency apartment in Putnam and Rockland counties and the NYC boroughs at \$1,163. To put these costs in national context, the National Low Income Housing Coalition (NLIHC) reports that New York was the fourth most expensive state in the country for housing in 2014 (NLIHC, 2015).

In the Household Survival Budget, housing for a family accounts for 18 percent of the budget, which is well below HUD’s affordability guidelines of 30 percent (HUD, 2013). For a single adult, however, an efficiency apartment accounts for 37 percent of the Household Survival Budget, well above the threshold at which the renter would be considered “housing burdened.” The availability of affordable housing units is addressed in Section V.

Child Care

In New York, income inadequacy rates are higher for households with children at least in part because of the cost of child care. The Household Survival Budget includes the cost of registered home-based child care at an average rate of \$1,363 per month (\$706 per month for an infant and \$657 for a 4-year old).

While home-based child care sites in New York are required to be registered with the state and are regulated for minimum quality program requirements, the quality of care that they provide may vary between locations. However, licensed and accredited child care centers, with more highly regulated standards of quality care, are significantly more expensive, with an average cost of \$1,755 per month (\$943 per month for an infant and \$812 for a 4-year-old). Child care costs in New York are compiled by the New York State Office of Children & Family Services (New York State Office of Children & Family Services, 2014).

Costs vary across counties: The least expensive home-based child care for two children, an infant and a preschooler, is found in rural Rest of State counties at \$1,208 per month, and the most expensive home-based child care is in Nassau, Putnam, Rockland, Suffolk, and Westchester counties at \$2,188 per month.

Child care for two children accounts for 26 percent of the family's budget, their greatest expense. The cost of child care in New York increased by 9 percent through the Great Recession from 2007 to 2014. These increases have made child care costs prohibitive for many ALICE families, not just in New York but nationwide. For example, a recent study from the Oregon Child Care Research Partnership found that it was 24 percent harder (measured by increase in prices combined with decrease in income) for a family to purchase care in 2012 than in 2004, and 33 percent harder for single parents (Weber, 2015).

“Child care for two children accounts for 26 percent of the family's budget, their greatest expense.”

Food

The original U.S. poverty level was based in part on the 1962 Economy Food Plan, which recognized food as a most basic element of economic well-being. The food budget for the Household Survival Budget is based on the U.S. Department of Agriculture's (USDA) Thrifty Food Plan, in keeping with the purpose of the overall budget to show the minimal budget amount possible for each category. The Thrifty Food Plan is also the basis for Supplemental Nutrition Assistance Program (SNAP, formerly food stamps) and Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) benefits.

Like the original Economy Food Plan, the Thrifty Food Plan was designed to meet the nutritional requirements of a healthy diet, but it includes foods that need a lot of home preparation time with little waste, plus skill in both buying and preparing food. The cost of the Thrifty Food Plan takes into account regional variation across the country but not localized variation, which can be even greater, especially for fruits and vegetables (Hanson, 2008; Leibtag, Ephraim, and Kumcu, 2011).

Within the Household Survival Budget, the cost of food in New York is \$612 per month for a family of two adults and two young children and \$202 per month for a single adult (USDA, 2014). The cost of food increased in New York by a surprisingly large 20 percent from 2007 to 2014, much higher than the 14 percent rate of inflation. The original FPL was based on the premise that food accounts for one-third of a household budget, so that a total household budget was the cost of food multiplied by three. Yet with the large increases in the cost of other parts of the household budget, food now accounts for only 12 percent of the Household Survival Budget for a family and 11 percent for a single adult in New York. Because the methodology of the FPL has not evolved in tandem with changing lifestyles and work demands, the FPL significantly underestimates the cost of even the most minimal household budget today.

Transportation

The fourth item in the Household Survival Budget is transportation, a prerequisite for most employment in New York. The average cost of transportation by car is several times greater than by public transport. According to the Consumer Expenditure Survey, a New York family pays an average of \$653 per month for gasoline, motor oil, and other vehicle expenses. By comparison, the average cost for public transportation is only \$72 per month, but public transportation is not widely available in most counties. The Household Survival Budget in Figure 17 shows state average transportation costs adjusted for household size. Actual county costs are shown in Appendix J.

Transportation costs represent 13 percent of the average Household Survival Budget for a family and 18 percent for a single adult. These costs are lower than in other budgets for households with incomes similar to ALICE. The Housing and Transportation Affordability

Index finds that for low-income New York households, transportation costs take up more than 9 percent of the household budget in NYC, and up to 30 percent in more rural parts of the Rest of State (Center for Neighborhood Technology, 2015).

Public transportation is typically the cheapest form of transportation, but it is only available in parts of New York. Where it is available, it can significantly reduce the cost of the Household Survival Budget for many families. In the counties outside of New York’s major metropolitan areas, fewer than 8 percent of workers use public transportation, so most of these workers must have a car to get to their jobs. The Household Survival Budget reflects the cost of using a car, which is a significant additional expense for ALICE households (American Community Survey, 2014).

Health Care

The fifth item in the Household Survival Budget is health care costs. The health care budget includes the nominal out-of-pocket health care spending indicated in the Consumer Expenditure Survey. In 2014, the average health care cost in New York was \$141 per month for a single adult (8 percent of the budget) and \$564 per month for a family (11 percent of the budget), which represents an increase of 56 percent from 2007 to 2014. Since it does not include health insurance, such a low health care budget is not realistic in New York, especially if any household member has a serious illness or a medical emergency.

ALICE does not qualify for Medicaid but cannot afford the Silver Plan (depending on eligibility for subsidies) or even the premiums for the high-deductible Bronze Marketplace Plan through the Affordable Care Act (ACA). For this reason, the cost of the “shared responsibility payment” – the penalty for not having coverage – is added to the current out-of-pocket health care spending. The penalty for 2014 is the higher of these: 1 percent of household income, yearly premium for the national average price of a Bronze Plan sold through the Marketplace, or \$95 per adult and \$47.50 per child under 18, for a maximum of \$285 (U.S. Centers for Medicare & Medicaid Services, 2016).

Seniors have many additional health care costs beyond those covered by Medicare. The Household Survival Budget does not cover these additional necessities, many of which can be a prohibitive additional budget expense for ALICE families. For example, according to the John Hancock 2013 Cost of Care Survey, poor health can add additional costs in New York, with wide geographic variation across the state. Costs for adult day care range from \$1,890 per month in the Bronx to \$3,990 in Manhattan; costs for assisted living range from \$2,400 per month in Middletown to \$7,060 in Manhattan (John Hancock, 2013).

Taxes

While not typically considered essential to survival, taxes are nonetheless a legal requirement of earning income in New York, even for low-income households. Taxes represent 16 percent of the average Household Survival Budget for a single adult and only 12 percent for a family with credits and exemptions. A single adult in New York earning \$21,540 per year pays on average \$291 per month (or \$3,492 annually) in federal and state taxes, and a family earning \$62,472 per year, benefiting from the federal Child Tax Credit and the Child and Dependent Care Credit, pays approximately \$622 per month (or \$7,464 annually). These rates include standard federal and state deductions and exemptions. The tax budget line item increased on average 35 percent from 2007 to 2014 (an increase of 20 percent for a single adult and 51 percent for a family of 4). The bulk of this increase can be explained by the fact that as the basic household budget increased, the income needed to cover it increased, and higher income results in a larger tax bill.

“Public transportation is typically the cheapest form of transportation, but it is only available in parts of New York.”

Increases in the actual tax rates were modest, driven primarily by federal taxes (income payroll deduction taxes for Social Security and Medicare) and by New York taxes for those earning more than \$40,000. From 2007 to 2014, federal taxes increased by 9 percent for a family of 4 and decreased by 11 percent for a single adult. New York state income taxes, which account for a quarter of a household's taxes, remained flat from 2007 to 2014 for those earning under \$40,000, but rates rose for those earning more than \$40,000, and the income brackets increased slightly for all from 2012 to 2014. The net result was that from 2007 to 2014, New York state taxes for a single adult increased by 8 percent and for a family of 4 increased by 7 percent. NYC tax rates remained flat over the period (Internal Revenue Service (IRS) and New York State Department of Taxation and Finance, 2007, 2010 and 2014). For tax details, see Appendix C.

Two additional tax considerations are also relevant for many ALICE households: the Earned Income Tax Credit (EITC) and sales tax. The Earned Income Tax Credit (EITC), a benefit for working individuals with low to moderate incomes, is not included in the tax calculation because the gross income threshold for EITC is below the ALICE Threshold: \$49,186 vs. \$62,472 for a family of four and \$14,590 vs. \$21,540 for a working adult. However, many ALICE households at the lower end of the income scale are eligible for EITC (IRS, 2014). The IRS estimates that the federal EITC helped more than 1.8 million families in New York in 2014, reaching 83 percent of those eligible. In addition, between 2011 and 2013 the federal EITC and the Child Tax Credit lifted 597,000 New York taxpayers and their households out of poverty, including 307,000 children. The New York EITC is 30 percent and the NYC EITC is 5 percent of the federal credit (Internal Revenue Service, 2014; Tax Policy Center, 2015; Center on Budget and Policy Priorities, 2013; New York State Department of Taxation and Finance, 2015; Internal Revenue Service, 2013).

“Between 2011 and 2013 the federal EITC and the Child Tax Credit lifted 597,000 New York taxpayers and their households out of poverty, including 307,000 children.”

In terms of sales tax, there is none on most items in the Basic Household Survival Budget (housing, food, child care, and health care). However, ALICE pays the state sales tax on goods outside the budget. Clothing and footwear under \$110 are exempt from New York City and New York State Sales Tax. Purchases above \$110 are subject to a 4.5 percent NYC Sales Tax and a 4 percent New York State Sales Tax. In addition, most counties levy a sales tax ranging from 3 percent to 4.88 percent (NYC Department of Finance, 2016; Sales Tax Handbook, 2016).

Because the Household Survival Budget is based on the cost of renting, there is no property tax in the tax portion of the budget. Property taxes are passed on to renters in the form of higher rents. And property taxes can be an issue for ALICE homeowners, as discussed further in Chapter VI.

In every state in the U.S., at least some low- or middle-income groups pay more of their income in state and local taxes than do wealthy families. According to the Tax Inequality Index from the Institute on Taxation and Economic Policy (ITEP), New York has the 41st most unfair state and local tax system in the country. The state's comparatively high state and local sales tax rates, as well as the cigarette tax rate, are regressive and impact middle- and low-income residents more than the wealthiest residents (New York State Department of Taxation and Finance, 2014; ITEP, 2013).

Household Survival Budget by Region

The cost of living varies across New York; the Household Survival Budget for a family of four ranges from \$78,720 in the counties surrounding NYC to \$64,092 in NYC to \$60,036 in the Rest of State. The biggest differences regionally are for housing, child care, and transportation. Housing is most expensive in NYC and the surrounding counties; child care is most expensive in the surrounding counties; and transportation is most expensive in the Rest of State, where public transportation is generally not available.

Figure 18.
Household Survival Budget, New York Regions, 2014

	 New York City		 Counties Surrounding New York City		 Rest of State

What is Missing from the Household Survival Budget?

The Household Survival Budget is a bare-minimum budget, not a “get-ahead” budget. The small Miscellaneous category, 10 percent of all costs, covers overflow from the five basic categories. It could be used for essentials such as toiletries, diapers, cleaning supplies, or work clothes. With changes in technology over the last decade, phone usage has shifted so dramatically that the Miscellaneous category could also have to cover the cost of a smartphone, which many people use in place of a home landline. According to the Pew Research Center, nearly two-thirds (64 percent) of U.S. adults owned a smartphone in 2014, up from 35 percent in 2011. Nearly half (46 percent) of smartphone owners say their smartphone is something “they couldn’t live without.” Yet at the same time, this added expense has presented new challenges. Almost one-quarter (23 percent) of Pew survey respondents report that they have canceled or suspended their smartphone service at some point because of cost (Pew Research Center, 2015).

The Miscellaneous category is not enough to purchase cable service or cover automotive or appliance repairs. It does not allow for dinner at a restaurant, tickets to the movies, or travel. There is no room in the Household Survival Budget for a financial indulgence such as holiday gifts or a new television – something that many households take for granted. This budget also does not allow for any savings, leaving a family vulnerable to any unexpected expense,

“This budget also does not allow for any savings, leaving a family vulnerable to any unexpected expense, such as a costly car repair, natural disaster, or health issue.”

such as a costly car repair, natural disaster, or health issue. For this reason, a household on a Household Survival Budget is described as just surviving. The consequences of this – for households and the wider community – are discussed in Section VI.

“The Stability Budget represents the basic household items necessary for a household to participate in the modern economy in a sustainable manner over time.”

THE HOUSEHOLD STABILITY BUDGET

Reaching beyond the Household Survival Budget, the Household Stability Budget is a measure of how much income is needed to support and sustain an economically viable household. The Stability Budget represents the basic household items necessary for a household to participate in the modern economy in a sustainable manner over time. In New York, the Household Stability Budget is \$116,268 per year for a family of four – nearly double the Household Survival Budget (Figure 19). That comparison highlights yet again how minimal the expenses are in the Household Survival Budget.

Figure 19.

Average Household Stability Budget vs. Household Survival Budget, New York, 2014

New York Average - 2014			
2 ADULTS, 1 INFANT, 1 PRESCHOOLER			
	Survival	Stability	Percent Difference
Monthly Costs			
Housing	\$919	\$1,201	31%
Child Care	\$1,363	\$1,755	29%
Food	\$612	\$1,159	89%
Transportation	\$653	\$1,119	71%
Health Care	\$564	\$996	77%
Cell Phone	N/A	\$99	N/A
Savings	N/A	\$633	N/A
Miscellaneous	\$473	\$633	34%
Taxes	\$622	\$2,094	237%
Monthly Total	\$5,206	\$9,689	86%
ANNUAL TOTAL	\$62,472	\$116,268	86%
Hourly Wage	\$31.24	\$58.14	86%

Source: See Appendix D

The spending amounts in the Household Stability Budget are those that can be maintained over time. Better quality housing that is safer and needs fewer repairs is represented in the median rent for single adults and single parents and in ownership of a moderate house with a mortgage. Child care has been upgraded to licensed and accredited care, where quality is fully regulated. Food is elevated to the USDA’s Moderate Food Plan, which provides more variety than the Thrifty Food Plan and requires less skill and time for shopping and cooking, plus one meal out per month, which is realistic for a working family. For transportation, the Stability Budget includes leasing a car, which allows drivers to more easily maintain a basic level of safety and reliability. For health care, the budget adds in health insurance and is

“Because savings are a crucial component of self-sufficiency, the Household Stability Budget also includes a 10 percent savings category.”

represented by the cost of an employer-sponsored health plan. The Miscellaneous category represents 10 percent of the five basic necessities; it does not include a contingency for taxes, as in the Household Survival Budget.

Because most jobs now require access to the internet and a smartphone, this year’s Household Stability Budget includes the cost of a cell phone. These are necessary for work schedules, changes in start time or location, access to work support services, and customer follow-up. The least expensive option has been selected from Consumer Reports’ 2014 plan comparison. Full details and sources are listed in Appendix D, as are the Household Stability Budget figures for a single adult.

Because savings are a crucial component of self-sufficiency, the Household Stability Budget also includes a 10 percent savings category. Savings of \$633 per month for a family is probably enough to invest in education and retirement, while \$196 per month for a single adult might be enough to cover the monthly payments on a student loan or build toward the down payment on a house. However, in many cases, the reality is that savings are used for an emergency and never accumulated for further investment.

The Household Stability Budget for a New York family with two children is moderate in what it includes, yet it still totals \$116,268 per year. This is almost double both the Household Survival Budget of \$62,472 and the New York median household income of \$58,878 per year. To afford the Household Stability Budget for a two-parent family, each parent must earn \$29.07 per hour or one parent must earn \$58.14 per hour.

The Household Stability Budget for a single adult totals \$35,388 per year, significantly higher than the Household Survival Budget and just below the New York median earnings for a single adult of \$37,460. To afford the Household Stability Budget, a single adult must earn \$17.69 per hour.

Regionally, the cost of the Stability Budget also varies across the state, ranging from \$147,684 for a family of four in NYC to \$145,896 in the counties surrounding NYC to \$108,960 in the Rest of State. The biggest differences regionally are for housing, child care, and transportation. Housing is most expensive in NYC; child care is most expensive in the counties surrounding NYC followed closely by NYC; and transportation is least expensive in NYC and in the portions of the counties surrounding NYC where public transportation is available.

COMPARISON WITH OTHER BUDGETS

How do the Household Survival and Stability Budgets compare with other measures? The Household Survival Budget is designed to measure the absolute minimum required to live and work in the modern economy, and thus in all cases relies on the most conservative estimate; it is not sustainable over time. It is the lowest of all family budget measures except the FPL. The FPL is not based on the actual cost of basic household goods in a specific county. As discussed earlier, the FPL is based on three times the cost of a minimally adequate diet in the 1960s, with adjustments for inflation; for a family of two adults and two children, the FPL totaled \$23,850 in 2014.

The Self-Sufficiency Standard (SSS), which applies only to NYC, aims to provide a slightly higher standard of living, presenting an accurate and nuanced measure of how much income a family of a certain composition living in a certain place must earn to meet their basic needs at a minimally adequate level. As such, the SSS selects the lowest costs to cover basic necessities that ensure self-sufficiency, accounting for availability of goods and services in a particular region. This adds greater costs for adequate housing and child care, more nutritious food, and less risky transportation and health care (Pearce, 2014).

The MIT Living Wage Calculator and the Economic Policy Institute's (EPI) Family Budget Calculator are each also slightly more expensive than the Household Survival Budget, but both are limiting and would be difficult to sustain for long periods of time (MIT, 2016; Economic Policy Institute, 2014).

To put all of these budgets in perspective, the Household Stability Budget estimates the cost for the range of household items at the level needed to support and sustain an economically viable household – and it is significantly higher than all other measures and New York's median family income (Figure 20).

Looking at the different budgets for a family of four in Queens County provides an example. Comparing the Household Survival Budget and the **Self-Sufficiency Standard** for this household, the Survival Budget assumes lower costs in all categories:

- **Housing:** Both reflect HUDs 40th rent percentile for a two-bedroom apartment, which includes all utilities whether paid by the landlord/owner or by the renter. The SSS estimates the cost of housing so that adults and children have separate bedrooms, with up to two adults or children per room. For housing in Queens County (and each county and sub-county area of NYC), the SSS uses the median gross rent ratios by county calculated from the U.S. Census Bureau's 2012 American Community Survey 1-year estimates.
- **Child Care:** The Survival Budget reflects the cost of home-based child care for an infant and a 4-year-old: the SSS calculates a weighted average of home-based and center-based child care for an infant and a preschooler in full-time care, and school-age children in part-time care.
- **Food:** The Survival Budget reflects the cost for the USDA's Thrifty Food Plan; the SSS reports the USDA's slightly higher Low-Cost Food Plan that provides more resources to maintain adequate nutrition over the longer term.
- **Transportation:** The budgets each use a minimum threshold for public transportation: The Survival Budget uses 8 percent of commuters, and the SSS uses 7 percent. Queens County, where more than half of residents commute by public transportation, is well above both thresholds. The Survival Budget cost is based on the Consumer Expenditure Survey, and the SSS uses the cost of a 30-day Unlimited Ride MetroCard from the NYC Metropolitan Transit Authority.
- **Health Care:** The Survival Budget reflects the cost of out-of-pocket health care expenses and the ACA penalty but not any costs of health insurance; the SSS reports the cost of employer-sponsored health insurance and out-of-pocket health care expenses.
- **Miscellaneous:** Both plans have a modest additional category of 10 percent.
- **Taxes:** Both plans incorporate the range of federal and state income and payroll taxes and the credits for which families are eligible (Child Care and Child Tax Credits). Since taxes are based on the budget, the higher the overall budget amounts, the higher the taxes.

The result is that the Self-Sufficiency Standard is 34 percent higher than the Survival Budget for a family of four in Queens County (Pearce, 2014).

Comparing the Household Survival Budget and the **MIT Living Wage Calculator** for a family of four in Queens County, the Survival Budget assumes lower costs in all categories: One caveat to this comparison is that the only data available for the Living Wage Calculator is 2015, and all other budgets are 2014 numbers.

“The MIT Living Wage Calculator and the Economic Policy Institute’s (EPI) Family Budget Calculator are each also slightly more expensive than the Household Survival Budget, but both are limiting and would be difficult to sustain for long periods of time.”

“The cost of licensed and accredited child care centers used by EPI is significantly higher than the Survival Budget’s home-based child care.”

- **Housing:** The Survival Budget reflects HUDs 40th rent percentile for a two-bedroom apartment, which includes all utilities whether paid by the landlord/owner or by the renter. MIT also uses HUD’s parameters but adds additional utilities to HUD’s rent estimates.
- **Child Care:** The Survival Budget reflects the cost of home-based child care for an infant and a 4-year-old. MIT selects the lowest-cost child care option available (which is usually home-based care), but for a 4-year-old and a school-age child, whose costs are generally lower.
- **Food:** The Survival Budget reflects the cost for the USDA’s Thrifty Food Plan for a family; MIT reports the USDA’s slightly more generous Low-Cost Food Plan for a family.
- **Transportation:** The two budgets are similar in terms of operating costs for a car, but the Survival Budget uses a minimum threshold for public transportation of 8 percent of commuters and reflects the cost reported by the Consumer Expenditure Survey for Queens County, which far exceeds that threshold. MIT transportation reflects the operating costs for a car, as well as the cost of vehicle financing and insurance.
- **Health Care:** The Survival Budget reflects the cost of out-of-pocket health care expenses and the ACA penalty; MIT instead reports the cost of employer-sponsored health insurance, medical services and supplies, and prescription drugs.
- **Miscellaneous:** Both plans have a modest additional category. In the Survival Budget, it is 10 percent of the budget for cost overruns; in MIT’s budget, it is a category for essential clothing and household expenses.
- **Taxes:** The methodology in the two plans is similar for **Taxes**, but since taxes are based on the budget, the higher the overall budget amounts, the higher the taxes.

The result is that the MIT Living Wage Calculator allows slightly more cushion for households, and the total is 23 percent higher than the Survival Budget for a family of four in Queens County (Glasmeier and Nadeau, 2015, 2015).

Comparing the Household Survival Budget and the **EPI’s Family Budget Calculator** for Queens County for a family of four, the Survival Budget assumes lower costs in most categories:

- **Housing:** The Survival Budget reflects HUDs 40th rent percentile for a two-bedroom apartment, which includes all utilities whether paid by the landlord/owner or by the renter. EPI also uses HUD’s parameters but adds additional utilities to HUD’s rent estimates.
- **Child Care:** The cost of licensed and accredited child care centers used by EPI is significantly higher than the Survival Budget’s home-based child care. This is despite the fact that EPI budgets for slightly older children – a “young child” (4-years-old) and a “child” (9-years-old) – whose care costs are considerably lower than the Household Survival Budget’s calculations for an infant and a preschooler.
- **Food:** The Survival Budget reflects the cost for the USDA’s Thrifty Food Plan for a family, while the Family Budget Calculator uses the USDA’s Low-Cost Food Plan for the sum of the cost for each person in the family.
- **Transportation:** The two budgets are similar in terms of operating costs for a car, but the Survival Budget uses a minimum threshold for public transportation of 8 percent of commuters and reflects the cost reported by the Consumer Expenditure Survey for Queens County, which far exceeds that threshold. EPI does not have a public transportation option, so the cost in Queens reflects the operating costs for a car, as well as fixed costs such as depreciation, lease payments, insurance, registration and license fees, and personal property taxes.

- **Health Care:** The Survival Budget reflects the cost of out-of-pocket health care expenses and the ACA penalty; the Family Budget Calculator reports the cost based on the least expensive Bronze Plan.
- **Miscellaneous:** The Survival Budget allocates 10 percent for cost overruns, but the Family Budget Calculator also includes costs for apparel, personal care, and household supplies.
- **Taxes:** The methodology in the two plans is similar for **Taxes**, but since taxes are based on the budget, the higher the overall budget amounts, the higher the taxes.

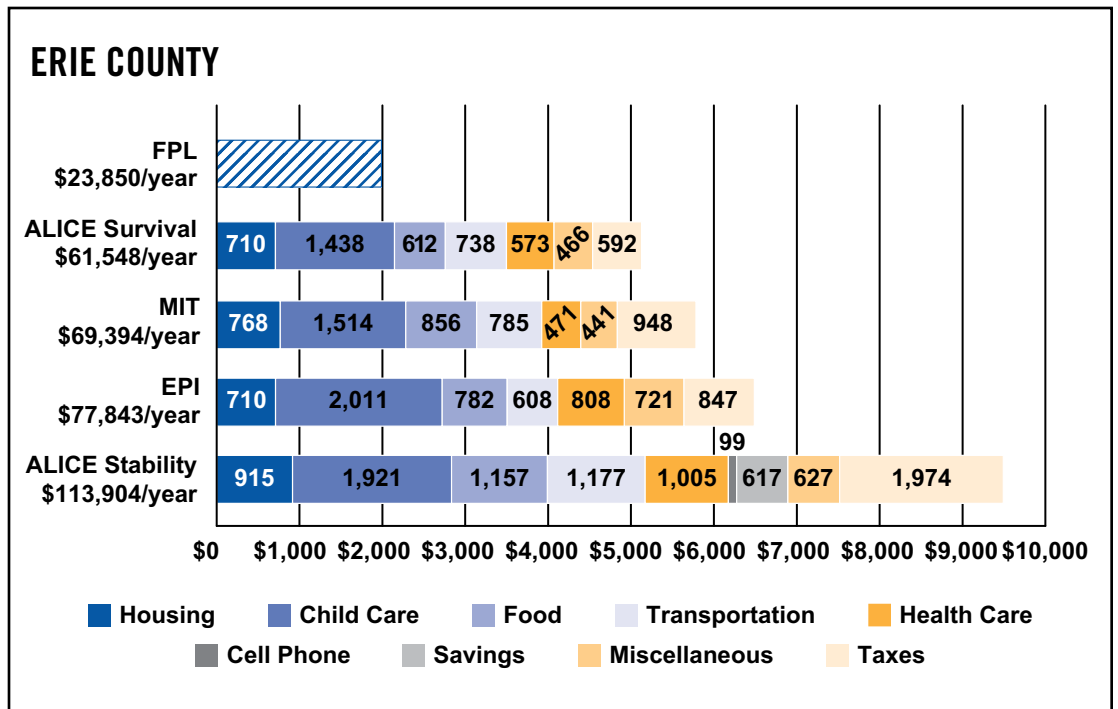

The result is that the Family Budget Calculator allows more cushion for households, and the total is 54 percent higher than the Survival Budget for a family of four in Queens County (Economic Policy Institute, 2014).

While the Household Survival Budget provides the lowest estimate of a household’s needs, the **Household Stability Budget** approximates a sustainable but still modest budget and is therefore higher than the other scales measured here. It includes a 30-year mortgage for a three-bedroom house, licensed and accredited child care, the USDA’s Moderate Food Plan (and two meals out per month), leasing a car, employer-sponsored health care, the cost of a cell phone, and savings. At an annual budget of \$144,504 for a family with two working adults and two children in Queens County, the Stability Budget exceeds the Self Sufficiency Standard by 69 percent, EPI’s Family Budget Calculator by 46 percent, and the MIT Living Wage Calculator by 83 percent.

The trends in budget comparisons are similar in other parts of the state. In fact, in all counties, the ALICE Household Survival Budget remains the least expensive after the FPL, and the ALICE Stability Budget remains the most expensive. For example, Figure 20 compares the Household Survival Budget in Erie County to the MIT Living Wage Calculator and to the EPI Family Budget for the Buffalo/Niagara Falls metro area. Figure 20 also compares the Household Survival Budget in Monroe County to the MIT Living Wage Calculator and to the EPI Family Budget for the Rochester metro area. (The Self-Sufficiency budgets are only available for New York City).

“In fact, in all counties, the ALICE Household Survival Budget remains the least expensive after the FPL, and the ALICE Stability Budget remains the most expensive.”

III. WHERE DOES ALICE WORK? HOW MUCH DOES ALICE EARN AND SAVE?

AT-A-GLANCE: SECTION III

- Both the Great Recession and the reshaping of the U.S. economy over the last 35 years have had an impact on the economy in New York.
- In 2014, the unemployment rate in New York was 6.4 percent*, near the national rate of 6.2 percent – and the underemployment rate was 12.4 percent, slightly below the national rate of 13.8 percent.
- In New York, 55 percent of jobs pay less than \$20 per hour, with 51 percent of those paying between \$10 and \$15 per hour.
- A full-time job that pays \$15 per hour grosses \$30,000 per year, which is less than half of the Household Survival Budget for a family of four in New York.
- There are more than 310,540 retail salespersons jobs in New York, paying on average of \$10.32 per hour. This salary falls short of meeting the family Household Survival Budget by more than \$41,000 per year.
- In 2011, 33 percent of New York’s households had less than \$4,632 in savings or other assets.
- From 2007 to 2012, housing values dropped by 16 percent in New York, and many homeowners who could not keep up with mortgage payments were forced to sell their homes at a loss.
- Many households in New York do not use basic banking services. In 2011, 45 percent of New York’s households with an annual income below \$50,000 had used an Alternative Financial Product (AFP) such as non-bank money orders or non-bank check cashing.

*New York state average unemployment rate for 2014 from the Bureau of Labor Statistics (BLS). Note that Appendix J, the New York County Pages, uses the 2014 New York state average unemployment rate from the American Community Survey, which was 7.3 percent, and the national average of 7.2 percent.

“More than any demographic feature, ALICE households are defined by their jobs and their savings accounts.”

More than any demographic feature, ALICE households are defined by their jobs and their savings accounts. The ability to afford household needs is a function of income, but ALICE workers have low-paying jobs. Similarly, the ability to be financially stable is a function of savings, but ALICE households have few or no assets and little opportunity to amass liquid assets. As a consequence, these households are more likely to use costly alternative financial services and to risk losing their housing in the event of an unforeseen emergency or health issue. This section examines the declining job opportunities and savings trends for ALICE households in New York.

Changes in the labor market over the past 35 years, including labor-saving technological advances, the decline of manufacturing, growth of the service sector, increased globalization, declining unionization, and the failure of the minimum wage to keep up with inflation, have reshaped the U.S. economy. Most notably, middle-wage, middle-skill jobs have declined while lower-paying service occupation levels have grown (Autor, 2010; National Employment Law Project, 2014). These changes have greatly impacted the New York economy.

Changes in employment and the labor force from 2009 to 2014 were uneven across New York and across industries. New York City and the surrounding counties experienced strong employment growth over the five-year period, while more than half of the Rest of State experienced job losses. NYC was the only region that experienced growth in its labor force, with the labor force declining in all the other regions of the state. The leisure and hospitality industry and the education and health services industry experienced the strongest growth across the state. Manufacturing continued decades of decline overall, but there were increases in manufacturing jobs in parts of the Rest of State, especially Western New York and the Capital Region (Office of Budget and Policy Analysis, 2015).

Often, evaluation of a state economy focuses primarily on the amount of investment in given industries and their contribution to the state's Gross Domestic Product (GDP). Yet these factors do not always match what an industry contributes to employment or wages (Figure 21). For example, in New York, the largest industry in terms of contribution to GDP is financial activities, but in contribution to employment, this industry ranks sixth out of 9 statewide. Conversely, several industries – including education and health services; trade, transportation, and utilities; and government – carry more weight as employers than their financial contribution to GDP would indicate (Bureau of Labor Statistics (BLS), 2016; U.S. Department of Commerce, Bureau of Economic Analysis, 2014).

“Changes in employment and the labor force from 2009 to 2014 were uneven across New York and across industries.”

Figure 21.
Employment and GDP by Industry, New York, 2014

Source: Bureau of Labor Statistics, 2014

“Changes in New York’s economy over the last several decades have reduced the job opportunities for ALICE households. The state now faces an economy dominated by low-paying jobs.”

In many regards, New York has recovered from the Great Recession. While the state lost 3 percent of its GDP between 2007 and 2008, it rebounded by 2010 and has improved steadily since, reaching \$1.2 trillion in 2014 (Federal Reserve, 2016).

The size of the labor force did not dip in New York during the Great Recession as it did in some states. However, the labor participation rate – the proportion of working-age individuals who are in the labor force – has fallen steadily from its high of 68.8 percent in 1989 to 61 percent in 2014. That decline reflects both the state’s aging population and the difficulty that workers have had finding desirable jobs (Bureau of Labor Statistics, 2014a; HUD, 2006; Office of Budget and Policy Analysis, 2015).

New York had a more extreme employment trajectory than the rest of the U.S. during and after the Great Recession, but recently it has moved toward the national average. The state’s recent historical low unemployment rate was 3.2 percent in 1999. In 2010, unemployment rose to 10.9 percent, and then dropped to 6.4 percent in 2014, near the national rate of 6.2 percent (Bureau of Labor Statistics, 2014; Bureau of Labor Statistics, 2014). These changes to New York’s economy have had a significant downward effect on both the income and the assets of ALICE households.

New York City accounts for 43 percent of the state’s labor force and 60 percent of the state’s jobs, and in many ways is a unique economy, bigger than those of many states. Unlike most of the rest of the state, NYC and the surrounding counties exhibited strong gains in both employment and total wages over the course of the economic expansion. Several unique features account for this: First, the labor participation rate has always been significantly lower in NYC; it was only 59 percent in 1989. But unlike other regions in the state and the rest of the country, it has increased over time, reaching 60.8 percent in 2014 – similar to the state average, for the first time in decades (Bureau of Labor Statistics, 2014a). Second, the financial activities and information industries – the two major employment sectors with large wage increases (more than 25 percent from 2009 to 2014) – are concentrated in NYC. Third, the two industries with the largest declines in employment – manufacturing and government – are primarily located outside the city (Office of Budget and Policy Analysis, 2015).

INCOME CONSTRAINED

One of the defining characteristics of ALICE households is that they are “Income Constrained.” Changes in New York’s economy over the last several decades have reduced the job opportunities for ALICE households. The state now faces an economy dominated by low-paying jobs. **In New York, 55 percent of jobs pay less than \$20 per hour, with more than half of those paying between \$10 and \$15 per hour (Figure 22). A full-time job that pays \$15 per hour grosses \$30,000 per year, which is less than half of the Household Survival Budget for a family of four in New York.** Another 33 percent of jobs pay between \$20 and \$40 per hour, with half of those paying between \$20 and \$30 per hour. Only 9 percent of jobs pay between \$40 and \$60 per hour; 3.1 percent pay between \$60 and \$80 per hour, and another 0.8 percent pay above \$80 per hour (Bureau of Labor Statistics, 2014).

Figure 22.
Number of Jobs by Hourly Wage, New York, 2014

Source: Bureau of Labor Statistics, 2014

“Over the last several decades, New York industries have experienced broad-based changes including a structural shift in the manufacturing sector and a scaling back of the government sector.”

Just as the Household Survival Budget varies by region across the state, so do the wages of jobs in metropolitan areas across the state (Figure 23). The percent of jobs paying less than \$20 per hour is much lower in NYC (48 percent) than in Elmira (76 percent) (Bureau of Labor Statistics, 2014). Interestingly, the areas with larger numbers of jobs (gold markers in Figure 23) have lower percentages of low-paying jobs. However, in absolute terms, NYC has 2.6 million jobs that pay less than \$20 per hour, more than half (55 percent) of all the state’s jobs that pay less than \$20 per hour.

Figure 23.
Number of Jobs by Hourly Wage, New York Metropolitan Areas, 2014

Source: Bureau of Labor Statistics, 2014

Over the last several decades, New York industries have experienced broad-based changes including a structural shift in the manufacturing sector and a scaling back of the government sector. From 2007 to 2014, the total number of jobs increased from 8.4 million to 8.8 million, and the percent of jobs paying less than \$20 per hour fell from 59 percent to 55 percent (Figure 24). Some low-paying jobs disappeared while others experienced slight wage increases. These figures have not been adjusted for inflation, which was about 14 percent over the period. Taking inflation into account, the percent difference would be slightly less across the board.

“Service sector jobs have become an essential and dominant component of New York’s economy, with occupations employing the largest number of workers now concentrated in this sector.”

Figure 24.
Number of Jobs by Hourly Wage, New York, 2007 to 2014

Source: Bureau of Labor Statistics, 2014

Growth in financial activities, the information industry, and business and professional services accounts for most of the state’s growth in higher-wage jobs, and most of those jobs are concentrated in NYC and the surrounding counties.

Across the state from 2007 to 2014, the number of jobs varied across the 13 major metropolitan areas:

- Five experienced a reduction in total jobs (Binghamton, Utica-Rome, Elmira, Kingston, and Albany-Schenectady-Troy).
- Three remained flat (Syracuse, Poughkeepsie-Newburgh-Middletown, and Rochester).
- The rest experienced an overall increase in the number of jobs: by 3 percent in Buffalo-Niagara Falls, Nassau-Suffolk Metropolitan Division, and Glens Falls; by 9 percent in New York-White Plains-Wayne-NJ Metropolitan Division; and by 17 percent in Ithaca (Bureau of Labor Statistics, 2007 and 2014; Office of Budget and Policy Analysis, 2015).

At the same time, the Center for Economic and Policy Research estimates that relative to 1979, the national economy has lost about one-third of its capacity to generate good jobs – those that pay at least \$37,000 per year and offer employer-provided health insurance and an employer-sponsored retirement plan (Schmitt and Jones, 2012).

Service sector jobs have become an essential and dominant component of New York’s economy, with occupations employing the largest number of workers now concentrated in this sector. Two hallmarks of the service sector economy are that these jobs pay low wages and workers must be physically on-site; cashiers, nurses’ aides, and security guards cannot telecommute or be outsourced. Of the top 20 largest occupations in terms of number of jobs (Figure 25), all require the worker to be there in person, yet only 14 percent of the jobs – stemming from just 3 of the 20 occupations – pay enough to support the average New York family Household Survival Budget at more than \$31.24 per hour. This means that New York’s economy is dependent on jobs that pay wages so low that workers cannot afford to live near their jobs even though most are required to work on-site.

Low-paid, service-sector workers cannot afford the Household Survival Budget. For example, the most common occupation in New York is in retail sales; there are more than 310,540 retail salespersons’ jobs in the state, paying on average \$10.32 per hour, or \$20,640 full-time year round. **These jobs fall short of meeting the family Household Survival Budget by more than \$41,000 per year.**

Figure 25.

Occupations by Employment and Wage, New York, 2014

Occupation	Number of Jobs	Median Hourly Wage
Retail Salespersons	310,540	\$10.32
Office Clerks	207,560	\$14.11
Janitors and Cleaners	194,820	\$13.44
Secretaries and Administrative Assistants	193,460	\$17.94
Cashiers	191,470	\$9.16
Registered Nurses	169,560	\$36.50
Food Prep, Including Fast Food	157,570	\$8.94
Waiters and Waitresses	151,270	\$9.28
Customer Service Representatives	150,070	\$17.04
Home Health Aides	146,550	\$10.37
General and Operations Managers	146,050	\$57.27
Personal Care Aides	142,220	\$10.98
Stock Clerks and Order Fillers	122,360	\$10.51
Teacher Assistants	118,970	\$13.26
Bookkeeping and Auditing Clerks	114,770	\$19.00
First-Line Supervisors of Administrative Support Workers	114,490	\$28.38
Security Guards	105,290	\$14.42
Nursing Assistants	101,030	\$15.87
Laborers and Movers, Hand	98,770	\$12.42
Accountants and Auditors	97,620	\$37.52

“Jobs paying less than \$20 per hour are more likely to be part time. With women working more part-time jobs, their income is correspondingly lower than that of their male counterparts.”

Source: Bureau of Labor Statistics, Occupational Employment Statistics (OES) Wage Survey – All Industries Combined, 2014

In addition to those who were unemployed in New York in 2014 (6.4 percent), there are many residents who are underemployed – people who are employed part time for economic reasons or who have stopped looking for work but would like to work (12.4 percent) (Bureau of Labor Statistics, 2014; Bureau of Labor Statistics, 2016).

Of the working age population, 54 percent of men (3,503,801) and 42 percent of women (2,792,770) work full time (defined as more than 35 hours per week, 50 to 52 weeks per year). However, 23 percent of men and 29 percent of women work part time. In addition, 22 percent of men and 29 percent of women are not working, including both the unemployed and people not looking for work (Figure 26). Jobs paying less than \$20 per hour are more likely to be part time. With women working more part-time jobs, their income is correspondingly lower than that of their male counterparts (American Community Survey, 2014).

“Both the number of New York households with earnings and the amount of those earnings dipped slightly during the Recession.”

Figure 26.

Full-Time and Part-Time Employment by Gender and Median Earnings, New York, 2014

Source: American Community Survey, 2014

Shifts in Sources of Income

The most important source of income for ALICE families is earnings. Both the number of New York households with earnings and the amount of those earnings dipped slightly during the Recession. The amount of earnings has recovered better than has the number of households with earnings; some households are still struggling, while others are better off.

The number of New York households earning a wage or salary income in 2007 was 5.38 million; that number remained flat until 2010, then increased by 1 percent from 2010 to 2014 to 5.43 million, making New York one of the few states that has surpassed its 2007 level (Figure 27). The aggregate amount of earnings for all workers in New York increased by even more: Starting at \$453 billion in 2007, it increased by 2 percent from 2007 to 2010 and then by 12 percent from 2010 to 2014, to reach \$572 billion. Given the large number of low-wage jobs in the state, this growth suggests that many at the higher end received most of these gains (American Community Survey, 2014).

Figure 27.

Earnings by Number of Households and Aggregate Total, New York, 2014

Source: American Community Survey, 2014

The sources of income for New York households shifted during the period from 2007 to 2014, which shows that the economy impacted different families in different ways (Figure 28). The toughest economic years were during the Great Recession, from 2007 to 2010, when most of the changes occurred (shown in Figure 28 in darkest blue). Most of the trends have slowed, and a few reversed beginning in 2012, but none have returned to pre-2007 levels.

The number of households with self-employment income decreased by 4 percent from 2007 to 2010 and then by another 2 percent from 2010 to 2014. Interest, dividend, and rental income decreased by 13 percent during the Great Recession and then by another 2 percent over the next four years (American Community Survey, 2014).

Over the entire time period, the impact of the aging population was evident, resulting in a 1 percent increase in the number of households receiving retirement income and an 11 percent increase in households receiving Social Security income. New York had 46 percent of workers participating in employment-based retirement plans in 2013, the same as the national average (Corporation for Enterprise Development (CFED), 2016).

“The number of households with self-employment income decreased by 4 percent from 2007 to 2010 and then by another 2 percent from 2010 to 2014.”

Figure 28.
Sources of Income, by Number of Households, New York, 2007 to 2014

Source: American Community Survey, 2014

The impact of the financial downturn on households was also evident in the striking increase in the number of New York households receiving income from government sources other than Social Security. While not all ALICE households qualified for government support between 2007 and 2014, many that became unemployed during this period of extensive job loss across the state began receiving government assistance for the first time. The number of households receiving Temporary Assistance for Needy Families (TANF) or General Assistance (GA), programs that provide income support to adults without dependents, increased by 27 percent. However, at the same time that the need for TANF assistance has increased, the level of benefit has fallen to \$789 per family, a 6 percent decrease from 2007 to 2014. The number of households receiving Supplemental Security Income (SSI) increased by 26 percent; SSI includes welfare payments for low-income people who are 65 and older and for people of any age who are blind or disabled. At the same time, the number of households receiving SNAP (formerly Food Stamps) increased by 65 percent. Yet as with TANF, the benefit level per family has decreased, a 23 percent drop from 2007 to 2014 (American Community Survey, 2007 and 2014; Stanley, Floyd, & Hill, 2016; Kaiser Family Foundation, 2014; Center on Budget and Policy Priorities, 2015).

ASSET LIMITED

The second defining feature of ALICE households is their lack of assets. Without assets and with low incomes, ALICE households are especially vulnerable to unexpected emergencies or even small fluctuations in income, and they risk economic instability in the future because they lack the means to invest in education, home ownership, or a retirement account. Without savings, it is impossible for a household to become economically independent. The lack of assets also increases ALICE households' costs, such as alternative financing fees and high interest rates, which limit efforts to build more assets (Barr and Blank, 2009; Rothwell and Goren, 2011). **Nationally, the average wealth of the lower-income half of American households was \$11,000 in 2013 – 50 percent less than the average wealth of the lower-income half of households in 1989.** About a quarter of those families had zero or negative net worth (Yellen, 2014).

“Given the mismatch between the cost of living and the preponderance of low-wage jobs, accumulating assets is difficult in New York.”

Given the mismatch between the cost of living and the preponderance of low-wage jobs, accumulating assets is difficult in New York. In 2012, 33 percent of New York households were considered to be “asset poor,” defined by CFED as not having enough net worth to subsist at the poverty level for three months without income. In other words, an asset poor family of three in that year had less than \$4,632 in savings or other assets. The percentage of households without sufficient “liquid assets” was even higher, at 45 percent. “Liquid assets” include cash or a savings account, but not a vehicle or home (CFED, 2012) (Figure 29). A 2014 national survey by the Federal Reserve found that 47 percent of all respondents and two-thirds of respondents with a household income under \$40,000 either could not cover an emergency expense costing \$400 or would cover it by selling something or borrowing money (Federal Reserve, 2015).

Many more households would be considered “asset poor” if the criterion were an inability to subsist without income for three months at the ALICE Threshold instead of at the outdated Federal Poverty Level. The Pew Research Center reports that almost half of Americans – 48 percent of survey respondents – state that they often do not have enough money to make ends meet (Pew Research Center, 2012).

Figure 29.
Households by Wealth, New York, 2011

Source: Corporation for Enterprise Development, 2011

Types of Assets

Almost by definition, people with less income have fewer assets, but they also have different types of assets. Households with income in the lowest quintile are less likely than households in the highest income quintile to have assets of any kind, to have a regular checking account, or to own a motor vehicle. They are only half as likely to have interest-earning assets at financial institutions or to own a business or a home. They are also far less likely to own stocks or mutual funds, or to have an Individual Retirement Account (IRA) or a 401(k) savings plan (U.S. Census, 2011).

After a bank account, the most common assets are vehicles, homes, and investments. Data on wealth and assets at the state level is limited, but the American Community Survey provides some basic figures.

“Almost by definition, people with less income have fewer assets, but they also have different types of assets.”

Vehicles

Seventy percent of households in New York own a vehicle; most own two or three (Figure 30). “Vehicle” is a very broad category in the American Community Survey that includes cars, vans, sport utility vehicles, and trucks below one-ton capacity that are kept at home and used for non-business purposes; dismantled or immobile vehicles are not included. Nationally, the most commonly held type of non-financial asset in 2014 was a vehicle. Between 2010 and 2013, the share of families owning a vehicle declined slightly from 86.7 percent to 86.3 percent. In 2013, 31 percent of families had a vehicle loan (Bricker et al., September 2014). While cars offer benefits beyond their cash value, they are not an effective means of accumulating wealth because the value of a car normally decreases over time.

While public transportation is available in many urban areas, in many parts of New York owning a car is essential for work, yet many ALICE households need to borrow money in order to buy a vehicle. From 1999 to 2012, the auto debt per capita in New York more than doubled to \$2,870, the 11th-highest level in the country (Bankrate, 2014).

Nationally, low-income families are twice as likely to have a vehicle loan as all families. Many workers cannot qualify for traditional loans and resort to non-traditional financing such as car title loans. Most vehicle title borrowers take out multiple loans (80 percent) and have high default rates; one-third of borrowers experience a default, and one in five loans result in the repossession of the borrower’s vehicle. With little regulation on car title loans in New York, there is significant high-cost car title lending in the state; industry sales are over \$30 billion, the third-highest level in the country (Center for Responsible Lending, 2014; Zabritski, 2015; Consumer Financial Protection Bureau, 2016).

However, there is a robust national market in other kinds of subprime vehicle loans. “Buy Here Pay Here” loans account for 14 percent of the used-car loan market nationally, and banks, credit unions, and especially wholly owned finance subsidiaries of car manufacturers are also making subprime loans to customers. In fact, in 2014, 28 percent of new car loans and 57 percent of used car loans were subprime. In the current low-interest banking market, the average rate for a prime loan in 2014 was 5 percent, while the average subprime rate was far more attractive to lenders at 20 percent. That difference means that customers with fair credit spend about six times more to finance a vehicle than those with excellent credit, which equates to \$6,176 in additional interest payments over the life of a \$20,000, five-year loan (Kiernan, 2016; Jones, 2014).

“Housing wealth is the most important source of wealth for all but those at the very top, accounting nationally for 60 percent of assets for the lower-wealth half of all homeownership families in 2013.”

Home Ownership

The next most common asset in New York is a home, an asset that has traditionally provided financial stability. In 2014, 53 percent of New York households owned their homes, although nearly two-thirds of those had a mortgage. Interestingly, 37 percent of the state’s households with income below the ALICE Threshold owned their homes. Yet the number of homeowners in New York has fallen over the last decade. The overall rate of homeownership peaked in 2005 at 56 percent, and fell to 53 percent in 2014, one of the lowest rates in the country. Many who sold their homes lost money, with some owing more than the sale price. In addition, homeownership rates vary dramatically across the state and even within NYC’s five boroughs, ranging from 68 percent in 2014 in Richmond County (Staten Island) to 18 percent in the Bronx – the second-lowest rate of any county in the U.S. (Federal Reserve Bank of St. Louis, 2015; Willis, Austensen, Moriarty, Rosoff, & Sanders, 2016).

For those New York households that stretched to buy a home in the mid-2000s, the drop in the housing market caused serious problems. Low incomes and declining home values made it financially difficult for many ALICE homeowners to maintain their homes. In addition, with a contracted housing stock and increased demand, some residents who wanted to buy a home but did not have funds for a down payment or could not qualify for a mortgage turned to risky and expensive lease or rent-to-own options. In fact, 3 percent of the total population and 8 percent of unbanked households in New York have used a rent-to-own financial product (FDIC, 2013).

From 2007 to 2012, housing values dropped by 16 percent in New York, according to the Federal Reserve’s House Price Index. This decline, combined with unemployment, underemployment, and reduced wages, meant that many households could not keep up their mortgage payments. New York reported 3,670 completed foreclosures between 2012 and 2014. The foreclosure inventory remains high, and the 2014 rate in New York was 4.3 percent, significantly higher than the national average of 1.7 percent. Housing prices have started to recover but with great variation across the state; in the Rest of State, most have not even returned to their 2007 levels (Federal Reserve Bank of St. Louis, 2016; CoreLogic, June 2014).

Housing wealth is the most important source of wealth for all but those at the very top, accounting nationally for 60 percent of assets for the lower-wealth half of all homeownership families in 2013. These families’ overall wealth is significantly affected by changes in home prices, and even moreso for those who are highly leveraged. From 2007 to 2013, homeowners in the bottom half of households by wealth reported a drop of 61 percent in their home equity. However, on balance, homeownership remains an effective means of producing wealth, though slightly less so for lower-income households and households of color (Herbert, McCue, and Sanchez-Moyano, 2013; Yellen, 2014).

Figure 30.
Household Assets, New York, 2014

Source: American Community Survey, 2014

Investments

Investments that produce income, such as stocks or rental properties, are a less common asset; in 2014, only 21 percent of New York households had this type of investment (see black bar in Figure 30). While the American Community Survey does not report the value of investments, nationally, the bottom half of households by wealth owned only 2 percent of the country's stocks in 2013. The number of New York households receiving interest, dividend income, or net rental income decreased by 15 percent through the Great Recession, a clear consequence of the stock market crash. This large reduction fits with the national trend of reduced assets for households of all income types. The recovery has not helped these investments: In the four years following the end of the Recession, the number of households in New York receiving interest, dividend income, or net rental income decreased yet again, by 7 percent. When combined with an emergency, the loss of these assets forced many households below the ALICE Threshold (American Community Survey, 2007, 2012, and 2014; Yellen, 2014).

“From 1983 to 2010, middle-wealth families across the country experienced a 13 percent increase in wealth, compared to a 120 percent increase for the highest-wealth families.”

Declining Assets

The assets of an ALICE household are especially vulnerable when workers lose their jobs. According to The Pew Charitable Trusts Economic Mobility Project, during unemployment, a common strategy is to draw down retirement accounts. Penalties are charged for early withdrawals and retirement savings are diminished, putting future financial stability at risk (Boguslaw, Thomas, Sullivan, Meschede, Chaganti, and Shapiro, 2013). This will have an impact on those who retire before their assets can be replenished, as discussed in the Conclusion.

Data on wealth at the state level is limited, but the national information available suggests that New York fits within national trends of a decline in wealth for low-income households. From 1983 to 2010, middle-wealth families across the country experienced a 13 percent increase in wealth, compared to a 120 percent increase for the highest-wealth families. At the other end of the spectrum, the lowest-wealth families – those in the bottom 20 percent – saw their wealth fall below zero, meaning that their average debts exceeded their assets (McKernan, Ratcliffe, Steuerle, and Zhang, 2013).

“The biggest group of AFP users is people with income between \$30,000 and \$50,000.”

According to the Urban Institute, the racial wealth gap was even larger. The collapse of the labor, housing, and stock markets beginning in 2007 impacted the wealth holdings of all socio-economic groups nationally, but in percentage terms, the declines were greater for disadvantaged groups as defined by race/ethnicity, education, pre-Recession income, and household wealth (Pfeffer, Danziger, and Schoeni, 2013; McKernan, Ratcliffe, Steuerle, and Zhang, 2013).

A drop in wealth is also the reason many households fall below the ALICE Threshold. Drawing on financial assets that can be liquidated or leveraged, such as savings accounts, retirement accounts, home equity, and stocks, is often the first step households take to cope with unemployment. When these reserves are used up, financial instability increases (Boguslaw et al., 2013).

Alternative Financial Products

Once assets have been depleted, the cost of staying financially afloat increases for ALICE households. Generally, access to credit can provide a valuable source of financial stability, and in some cases does as much to reduce hardship as tripling family income (Mayer and Jencks, 1989; Barr and Blank, 2008). Just having a bank account lowers financial delinquency and increases credit scores (Shtauber, 2013). But many New York households do not use basic banking services. Because the banking needs of low- to moderate-income individuals and small businesses are often not filled by community banks and credit unions, they frequently use local networks and Alternative Financial Products (AFP) establishments, especially for small financial transactions (Flores, 2012; Servon and Castro-Cosio, 2015). **According to the Federal Deposit Insurance Corporation (FDIC), 8.5 percent of households in New York are unbanked, and 19.6 percent are underbanked** (i.e., households that have a mainstream account, but one so basic that there is still a need for alternative and often costly financial services for basic transaction and credit needs) (FDIC, 2013).

Informal lending groups range from loans from friends and family to rotating savings and credit associations to loan sharks. For the over-16-year-old population in the U.S., the World Bank estimates that in 2011, six percent of the population participated in an informal lending group and 17 percent borrowed from family and friends. Studies of low-income families show that as many as 40 percent borrow or lend informally (Morduch, Ogden, and Schneider, 2014; Servon and Castro-Cosio, 2015).

AFPs provide a range of services including non-bank check cashing, non-bank money orders, non-bank remittances, payday lending, pawnshops, rent-to-own agreements, and tax refund anticipation loans. **In 2011, 45 percent of New York households with an annual income below \$50,000 had used an AFP, and they accounted for 53 percent of the state’s AFP users.** In contrast, that figure was only 31 percent for households with an annual income above \$75,000 (FDIC, 2013). The biggest group of AFP users is people with income between \$30,000 and \$50,000. They represent a large demographic, and they have enough money to make financial transactions but not enough to qualify for higher-end financial services (FDIC, 2014). Groups with even lower income are more disproportionately represented among AFP users, with use increasing as income declines.

The most commonly used AFPs in New York are non-bank money orders, with 34 percent of all households and 57 percent of unbanked households having used a non-bank money order in 2011. The next most commonly used AFP is non-bank check cashing, used by 13 percent of all households and 48 percent of unbanked households. Non-bank remittances are used by 8 percent of all households and 16 percent of unbanked households. The use of other AFPs by the total population is 5 percent or less. However, unbanked households make use of a range of other AFPs: 13 percent have used pawnshops, 8 percent have used rent-to-own agreements, and 7 percent have used refund anticipation loans. Despite the fact that payday loans have been illegal in New York since 1976, 1 percent of households have used them (FDIC, 2013) (Figure 31).

Figure 31.

Use of Alternative Financial Products by Banking Status, New York, 2011

Source: Federal Deposit Insurance Corporation, 2013

Two tax-related AFPs are Refund Anticipation Loans (RALs) and Refund Anticipation Checks (RACs), which charge fees for advancing funds against tax returns and tax preparation, at rates estimated at more than 260 percent annual percentage rate (APR). According to IRS data, 94 percent of taxpayers who applied for a RAL and 84 percent who applied for a RAC in 2011 were low-income (Civil Justice, Inc, and Maryland CASH Campaign, 2013). RALs have declined since becoming federally regulated in 2012, but RAC use continues to rise.

A newly emerging AFP is the payroll card, a debit card that was used to pay wages to an estimated 5.8 million workers nationally in 2013, and that is expected to double in use by 2017. Payroll cards deliver wages electronically with cost savings for employers and, in some cases, convenience and lower expenses for workers. However, virtually all payroll card programs charge fees. In New York, the Attorney General found that payroll cards presented significant challenges for many workers, particularly low-wage workers and those with limited financial and literacy skills. In many cases the fees associated with these cards have been excessive, reducing take-home pay for the lowest-paid workers and those without internet access, who, for example, can be charged a fee just to call to learn their account balance. Industry regulation in New York is starting to curb excessive practices (New York State Attorney General Eric T. Schneiderman, 2014; Saunders, 2015; Young, 2016).

Access to Credit

Overall, few assets and a weak credit record mean that many ALICE families are vulnerable to predatory lending practices. This was especially true during the housing boom, which in part led to many of the foreclosures in New York (McKernan, Ratcliffe, and Shank, 2011).

“Overall, few assets and a weak credit record mean that many ALICE families are vulnerable to predatory lending practices.”

“Rent-to-own housing agreements are another way to access credit when traditional financial products are not available.”

New York had one of the highest rates of credit users with prime credit in 2014, at 53 percent. But more than 47 percent of the state’s credit users – and more who might need access to credit – still used subprime rates (CFED, 2016).

High-interest, unsecured debt from credit cards can be a useful short-term alternative to even higher-cost borrowing or the failure to pay mortgage, rent, and utility bills. For example, the cost of restoring discontinued utilities is often greater than the interest rate on a credit card. Another option is rent-to-own stores, which are lightly regulated in New York and which fill an important need by allowing families to access furniture, electronics, major appliances, computers, tires, and other products. Their use has proliferated both over the Internet and through 287 local businesses in New York with annual revenues of \$217 million (Consumer Financial Protection Bureau, 2016; National Conference of State Legislatures, 2016).

Rent-to-own housing agreements are another way to access credit when traditional financial products are not available. Usage in New York is lower than the national average (3.5 percent vs. 4.6 percent), and the highest usage rates are among the least financially stable New Yorkers: the unemployed (6.8 percent vs. 3 percent among the employed) and the disabled (9.2 percent vs. 3.9 percent among those not disabled). People between 25 and 34 years old used rent-to-own agreements most out of all age groups, and people with college degrees (1.4 percent) and those making more than \$50,000 per year (less than 1.7 percent) were the least likely to use them. People living farther from NYC were much more likely to use rent-to-own agreements than residents of NYC and the surrounding counties (9.5 percent in the Rest of state compared to 2.5 percent in the city and the surrounding counties) (FDIC, 2013).

IV. HOW MUCH INCOME AND ASSISTANCE IS NEEDED TO REACH THE ALICE THRESHOLD?

Measure 3 – The ALICE Income Assessment

AT-A-GLANCE: SECTION IV

- In New York in 2014, the total needed to ensure that all poverty and ALICE households had income at the ALICE Threshold was \$169.4 billion.
- The income of all New York households below the ALICE Threshold totaled \$85.6 billion – just 50.5 percent of total need.
- In 2014, public and private spending – excluding health care – on New York households below the ALICE Threshold, which includes families in poverty, provided an additional \$28.2 billion. This assistance left gaps to achieve the most basic financial need in many areas, including a 34 percent gap for housing and a 47 percent gap for child care. (This is a financial assessment of public and private assistance; additional analysis would be required to assess quality, safety or efficiency.)
- Public and private spending on health care totaled \$55 billion, or 66 percent of all spending on households below the ALICE Threshold in 2014. While in aggregate this was enough to meet the health care expenses of these households, many households required more than the average and most households received far less than the average. For households living below the ALICE Threshold in New York, the average expenditure by federal, state, and local government and nonprofit sources in 2014 was \$8,716 per household, plus another \$17,025 in health care spending.
- ALICE and poverty-level households in New York received an aggregate \$5.3 billion to reduce their taxes through the Earned Income Tax Credit (EITC) in 2014, for an average of \$3,035 per eligible household.
- Without public and nonprofit spending, ALICE households in New York would face great hardship, with many more qualified as living below the Federal Poverty Level (FPL).

“The persistence of low wages, underemployment, periods of unemployment, and loss of employer-sponsored benefits have led to financial insecurity for a large share of ALICE households.”

Forty-four percent of New York households do not have enough income to reach the ALICE Threshold for financial security. But how far below the ALICE Threshold are their earnings? How much does the government spend in an attempt to help fill the gap? And is it enough to enable all households to meet their basic needs?

The persistence of low wages, underemployment, periods of unemployment, and loss of employer-sponsored benefits have led to financial insecurity for a large share of ALICE households. As a result, many working ALICE households have turned to government supports and services, often for the first time, to feed their families, secure health insurance, pay rent, or meet other basic needs (Boguslaw et al., 2013).

“The total income of poverty-level and ALICE households in New York in 2014 was \$85.6 billion, which includes wages and Social Security. This is only 50.5 percent of the amount needed just to reach the ALICE Threshold of \$169.4 billion statewide.”

A wide range of families have used public and private assistance. The Pew Charitable Trusts Economic Mobility Project, a national survey of working-age families from 1999 to 2012, found that families facing unemployment and other financial hardship during the Great Recession turned to government, nonprofit, and private institutional resources as a safety net. More than two of every three families interviewed drew on one or more of these institutional resources, receiving help in categories as varied as income, food, health care, education and training, housing and utility assistance, and counseling. The lot of many of these families has not improved; for example, Feeding America reports seeing more regular clients (Boguslaw, et al., 2013; Feeding America, August 2014).

Recent national studies have quantified the cost of public services that support low-wage workers, specifically at big box retail chain stores and fast food restaurants, finding that in 2011, more than half – 56 percent – of combined state and federal spending on public assistance went to working families (Allegretto et al., 2013; Dube and Jacobs, 2004; Wider Opportunities for Women (WOW), 2011; Jacobs, Perry, and MacGillvary, 2016). But the total cost of public and nonprofit assistance for struggling households had not been tallied for a state until the first ALICE Report for New Jersey in 2012 (Hoopes Halpin, 2012).

The ALICE Income Assessment provides a tool to measure these resources for poverty and ALICE households. This tool is critical to understanding the financial dynamics and needs of poverty and ALICE households, especially those who are working. Because funds are allocated differently for different programs (some based on the FPL or multiples of it, others using local cost budgets), it is not possible to separate spending on ALICE from spending on those in poverty. In fact, some programs that are focused on those in poverty, such as Medicaid, end up supporting other low-income individuals as well (Finkelstein, Hendren, and Luttmer, 2015).

THE ALICE INCOME ASSESSMENT

The ALICE Income Assessment measures how much income households need to reach the ALICE Threshold (the bare minimum needed to live and work in the modern economy, not necessarily an objectively healthy or safe level). Then it compares the Threshold to how much households actually earn and how much public and nonprofit assistance is provided to help them meet their basic needs. The Assessment totals the income needed to reach the ALICE Threshold (see the Household Survival Budget in Section II), then compares that to earned income as well as government and nonprofit assistance. (This is a financial assessment of public and private assistance; additional analysis would be required to assess quality, safety or efficiency.)

Public assistance used in this analysis includes only programs that are directed specifically at low-income families and individuals; it does not include programs such as neighborhood policing or New York City’s newly adopted Pre-K for All program, which are provided to all households regardless of income. In addition, the Assessment includes only programs that directly help ALICE families meet the basic Household Survival Budget, such as TANF and Medicaid; it does not include programs that assist low-income families in broader ways, such as college subsidies.

Categories of Income and Assistance

The total income of poverty-level and ALICE households in New York in 2014 was \$85.6 billion, which includes wages and Social Security. This is only 50.5 percent of the amount needed just to reach the ALICE Threshold of \$169.4 billion statewide. Government and nonprofit assistance to New York households below the ALICE Threshold – which includes households in poverty – provided \$28.2 billion, and health care assistance provided another \$55 billion. Without health

care spending, there is an Unfilled Gap of 33 percent: In other words, it would take an additional \$55.6 billion in income or assistance to ensure that all New York households meet the ALICE Threshold. When health care spending is added, the gap almost closes (0.4 percent), but as discussed below, there are several reasons why additional health care spending cannot provide financial stability for ALICE and poverty families (additional details in Appendix E).

Figure 32.

Categories of Income and Assistance for Households below the ALICE Threshold, New York, 2014

“In 2014, the total annual public and private spending from federal, state and New York City sources on New York households below the ALICE Threshold was \$83.2 billion, or 7 percent of New York’s \$1.26 trillion Gross Domestic Product.”

Source: Office of Management and Budget, 2014; Department of Treasury, 2015; American Community Survey, 2014; National Association of State Budget Officers, 2014; NCCS Data Web, Urban Institute, 2012; see Appendix E

In 2014, the total annual public and private spending from federal, state and New York City sources on New York households below the ALICE Threshold was \$83.2 billion, or 7 percent of New York’s \$1.26 trillion Gross Domestic Product (Federal Reserve Bank of St. Louis, 2014). That spending included several types of assistance:

- Government Programs spent \$17.6 billion, or 10 percent of the total required for ALICE families to reach the ALICE Threshold.
- Cash Public Assistance delivered \$8.6 billion, adding another 5 percent.
- Nonprofits in the human services area provided \$1.96 billion, or 1 percent.
- Health Care assistance, a large category that provided an additional \$55 billion and is structured differently from other types of assistance, is discussed later in this section.

DEFINITIONS

- **Income** = Wages, dividends, Social Security
- **Health Care** = Medicaid, Children's Health Insurance Program (CHIP), community health benefits
- **Cash Public Assistance** = Supplemental Security Income (SSI) and Temporary Assistance for Needy Families (TANF)
- **Government Programs** = Head Start, Supplemental Nutrition Assistance Program (SNAP, formerly food stamps), Special Supplemental Nutrition Program for Women, Infants and Children (WIC), the Earned Income Tax Credit (EITC), housing, and human services, federal and state
- **Nonprofits** = Human services revenue not from the government or user fees
- **Unfilled Gap** = Shortfall to ALICE Threshold

Challenges of Public and Private Assistance

Without public assistance, ALICE households would face even greater hardship and many more would be in poverty, especially in the wake of the Great Recession. Programs like SNAP, the EITC and CTC, Medicaid, and, increasingly, food banks provide a critical safety net for basic household well-being and enable many families to work (Sherman, Trisi, and Parrott, 2013; Grogger, 2003; Dowd and Horowitz, 2011; Rosenbaum, 2013; Feeding America, August 2014; Coleman-Jenson, 2013). This analysis is not an evaluation of the efficiency of the programs in delivering good or services. However, research has shown that assistance is not always well-targeted, effective, and timely. There are several challenges to the ability of public and private assistance to meet basic needs.

First, the majority of government programs are intended to fill short-term needs, such as basic housing, food, clothing, health care, and education. By design, their goal is not to help households achieve long-term financial stability (Haskins, 2011; Shaefer & Edin, 2013) Ben-Shalom, Moffitt, and Scholz, 2012).

Second, crucial resources are often targeted to households near or below the FPL, so many struggling ALICE households are not eligible for assistance. Benefits are often structured to end before a family reaches stability, known as the "cliff effect". In New York, as earnings rise, SNAP benefits decrease once income reaches 130 percent of the FPL, or just \$31,005 for a family of four – slightly more than half of the Household Survival Budget for a family (New York State Office of Temporary Disability Assistance, 2016; National Conference of State Legislatures, October 2011).

Third, resources may not be available where they are needed, and this statewide analysis may mask geographic disparities in the various types of assistance. For example, while NYC contains 48 percent of the state's households below the ALICE threshold, residents receive 62 percent of Medicaid funds but only 43 percent of mental health funds (Rockefeller Institute of Government, 2011). If funding is disproportionately going to one part of New York, there could be unmet need, not reflected in the Income Assessment, in other parts of the state.

“Without public assistance, ALICE households would face even greater hardship and many more would be in poverty, especially in the wake of the Great Recession.”

Finally, because public and nonprofit assistance is allocated for specific purposes and often delivered as services, it can only be used for specific parts of the household budget. Only 5 percent of the assistance provided in New York is done through cash transfers, which households can use toward any of their most pressing needs. The remainder is earmarked for specific items, like food assistance or health care, for which the need varies across households below the ALICE threshold. This means that not all households benefit equally from assistance. For example, a household that does not visit a doctor for more than a checkup does not receive the average household health care expenditure in New York, while a household that experiences a medical emergency uses far more than that just to meet its needs.

“A breakdown of public and nonprofit spending in New York by category reveals that there are large gaps in key areas, particularly housing, child care, and transportation.”

Details for Spending Categories in New York

A breakdown of public and nonprofit spending in New York by category reveals that there are large gaps in key areas, particularly housing, child care, and transportation. Figure 33 compares the budget amounts for each category of the Household Survival Budget for a family of four (shown in dark blue) with the public and nonprofit spending in each category (shown in yellow cross-hatch), to show the gap or surplus in each budget area. The comparison assumes that the income households earn (shown in dark yellow) is allocated proportionately to each category.

Figure 33.

Comparing Basic Need with Public and Nonprofit Spending by Category (Excluding Health Care and Miscellaneous Expenses), New York, 2014

Source: Office of Management and Budget, 2014; U.S. Department of Agriculture, 2014; Internal Revenue Service, 2014; Department of Treasury, 2015; American Community Survey, 2014; National Association of State Budget Officers, 2014; NCCS Data Web, 2012; Council of the City of New York, 2014a, 2014b, 2014c, 2014d; Fiscal Policy Institute, 2014

“In the Household Survival Budget for a family of four, child care accounts for 26 percent of the family budget. Yet for many ALICE households, 26 percent of what they actually earn is not enough to pay for even home-based child care, the least expensive organized care option.”

Gap in Housing Resources

In the Household Survival Budget for a family of four, housing accounts for 18 percent of the family budget. Following this allocation, this analysis assumes that all ALICE households then spend 18 percent of their income on housing, which still leaves them far short of what is needed to afford rent at HUD’s 40th rent percentile. But does public assistance fill the gap? Federal housing programs provide \$4.1 billion in assistance, including Section 8 Housing Vouchers, the Low Income Home Energy Assistance Program, the Public Housing Operating Fund, and Community Development Block Grant (CDBG). New York City spends \$161,000 on the Home Energy Assistance Program (HEAP). In addition, nonprofits spend an estimated \$392 million on housing assistance statewide. (Because nonprofit spending is not available by category, the estimate for each category here is one-fifth of the total nonprofit budget.) Yet when income and government and nonprofit assistance for housing are combined, **there is still a 34 percent gap in resources for all households to meet the basic ALICE Threshold for housing.** Given that gap, it is not surprising that most families spend more of their income on housing, which leaves less for other items.

Gap in Child Care Resources

In the Household Survival Budget for a family of four, child care accounts for 26 percent of the family budget. Yet for many ALICE households, 26 percent of what they actually earn is not enough to pay for even home-based child care, the least expensive organized care option. Additional child care resources available to New York families include \$505.5 million in federal education spending for Head Start, the program that helps children meet their basic needs or is necessary to enable their parents to work. New York City also spends \$304 million to subsidize child care for low-income households. Though advanced education is vital to future economic success, it is not a component of the basic Household Survival Budget, so programs such as Pell grants are not included in the education spending figure. Nonprofits provide additional child care assistance including vouchers and child care services estimated at \$392 million. Yet when income and government and nonprofit assistance are combined, **there is still a 47 percent gap in resources for all households to meet the basic ALICE Threshold for child care.**

Gap in Food Resources

In the Household Survival Budget for a family of four, food accounts for 12 percent of the family budget, yet for many ALICE households, 12 percent of what they actually earn is insufficient to afford even the USDA Thrifty Food Plan. Food assistance for New York households include \$6.8 billion of federal spending on food programs, primarily the Supplemental Nutrition Assistance Program (SNAP, formerly food stamps), school breakfast and lunch programs, and the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). NYC spends \$69 million and statewide nonprofits spend \$392 million on food assistance, including food pantries, food banks, and soup kitchens. Yet when income and government and nonprofit food assistance are combined, **there is still a 13 percent gap in resources for all households to meet the basic ALICE Threshold for food.**

Gap in Transportation Resources

In the Household Survival Budget for a family of four, transportation accounts for 13 percent of the family budget. Yet for many ALICE households, 13 percent of what they actually earn is not enough to afford even the running costs of a car. While New York’s public transportation systems are state-funded, there is only \$45 million in NYC government spending on transportation targeted specifically to ALICE and

poverty families. However, nonprofits provide additional programs, spending an estimated \$392 million. When income and nonprofit assistance are combined, **there is a 47 percent gap in resources for all households to meet the basic ALICE Threshold for transportation.**

Taxes

In the Household Survival Budget for a family of four, taxes account for 12 percent of the family budget, so this analysis assumes that 12 percent of income is allocated towards taxes. The federal Earned Income Tax Credit (EITC) provides \$4.1 billion in tax credits and refunds, which were accessed by 83 percent of eligible working families in New York. In addition, New York EITC (worth 30 percent of the federal) provides an additional \$1.2 billion, and the NYC EITC (worth 5 percent of the federal) adds another \$370 million. Eligible New York households collected an average refund of \$3,035 from their taxes in 2014, which helped 1.8 million ALICE and poverty-level families (IRS, 2014; National Conference of State Legislatures, 2016). From 2011 to 2013, the federal and state EITC and the Child Tax Credit (CTC) lifted 597,000 New York taxpayers and their households out of poverty, including 307,000 children on average each year (Center on Budget and Policy Priorities (CBPP), 2015). The per-household amount depends on a recipient's income and the number of children they have. Yet when income and government credits and refunds are combined, **there remains a 21 percent gap in resources for all households to meet the basic ALICE Threshold for taxes.**

EITC filing data provides another window into households with income below the ALICE Threshold. In 2014, 18 percent of tax filers in New York were eligible for federal EITC. Of those, 24 percent were married households, 50 percent were single heads of households, and 26 percent were single adults. Their median Adjusted Gross Income was \$14,118. The industry that employed the most EITC-eligible workers was health care, followed by retail trade, and then accomodation and food services (Brookings Institution, 2014).

The Special Case of Health Care

Health care resources are separated from other government and nonprofit spending because they account for the largest single source of assistance to low-income households: \$55 billion, or 66 percent of all public and private spending on these households in New York. Health care spending includes federal grants for Medicaid, CHIP, and Hospital Charity Care; state matching grants for Medicaid, CHIP, and Medicare Part D Clawback Payments; and the cost of unreimbursed or unpaid services provided by New York hospitals (Office of Management and Budget, 2014; National Association of State Budget Officers (NASBO), 2014; NCCS Data Web Report Builder, 2012).

With the increasing cost of health care and the implementation of the Affordable Care Act (ACA), spending on health care doubled from 2000 to 2014, increasing more than any other category (New York State Comptroller, 2015). For this reason, spending on health care in New York surpasses the amount needed for each household to afford basic out-of-pocket health care expenses. However, even this level of assistance does not necessarily guarantee good or improved health to low-income New York households.

There are special challenges to estimating health care needs and costs and delivering health care efficiently to more than 3.2 million struggling New Yorkers. First, there is greater variation in the amount of money families need for health care than exists in any other single category. An uninsured (or even an insured) household

“There are special challenges to estimating health care needs and costs and delivering health care efficiently to more than 3.2 million struggling New Yorkers.”

“In New York, on average, health care spending per household in 2014 was \$17,025, while the average spending per household through other types of assistance was \$8,716.”

with a severe and sudden illness could be burdened with hundreds of thousands of dollars in medical bills in a single year, while a healthy household would have few expenses. National research has shown that a small proportion of households facing severe illness or injury account for more than half of all health care expenses, and those expenses can vary greatly from year to year (U.S. Department of Housing and Urban Development, 2010; Silletti, 2005; Culhane, Park, and Metraux, 2011).

The difference between health care spending and other types of assistance is also obvious in the average amount of spending per household below the ALICE Threshold. In New York, on average, health care spending per household in 2014 was \$17,025, while the average spending per household through other types of assistance was \$8,716. Combining the two categories, the average spending on each New York household below the ALICE Threshold was \$25,741 in cash and services, shared by all members of the household and spread throughout the year (Figure 34).

V. WHAT ARE THE ECONOMIC CONDITIONS FOR ALICE HOUSEHOLDS IN NEW YORK?

Measure 4 – The Economic Viability Dashboard

AT-A-GLANCE: SECTION V

- The Economic Viability Dashboard incorporates three indices – Housing Affordability, Job Opportunities, and Community Resources – for each county.
- Only three counties in New York scored in the highest third on all three indices of the Dashboard, and three counties scored in the lowest third on all three indices.
- On average, housing affordability in New York declined slightly from 2007 to 2014. Job opportunities fell sharply from 2007 to 2010, then began to improve, but they have not returned to their 2007 levels. Community resources fluctuated from 2010 to 2014, ultimately improving over the period.
- The average affordable housing gap in New York reflects an 11 percent shortage in rental and owner housing stock.
- On average in New York, 55 percent of renters pay more than 30 percent of their household income on rent, and 31 percent of owners pay more than 30 percent of their income on monthly owner costs.
- There is wide variation in job opportunities across New York; wages for new hires range from \$1,524 per month in Hamilton County to \$5,307 per month in New York County (Manhattan).
- Preschool enrollment, a marker of education resources in each county, varies widely: Only 24 percent of 3- and 4-year-olds are enrolled in Madison County, while 77 percent are enrolled in Putnam County.
- The share of voting-age New York residents who voted in the 2012 presidential election was 53 percent, just below the national average of 58 percent.

“For ALICE in particular, local economic conditions largely determine how many households in a county or state struggle financially. These conditions also determine how difficult it is to survive without sufficient income and assets to afford basic household necessities.”

Place matters. The Harvard Equality of Opportunity Project has brought to the fore the importance of where we live, and especially where we grow up, in determining the directions that our lives take (Chetty and Hendren, April 2015). For ALICE in particular, local economic conditions largely determine how many households in a county or state struggle financially. These conditions also determine how difficult it is to survive without sufficient income and assets to afford basic household necessities.

In order to understand the challenges that the ALICE population faces in New York, it is essential to recognize that local conditions do not impact all socio-economic and geographic groups in the same way. For example, New York’s high GDP obscures the lack of high-skilled jobs in many counties.

By contrast, county unemployment statistics clearly reveal where there are not enough jobs. Yet having a job is only part of the economic landscape for ALICE households. The full picture requires an understanding of the types of jobs available and their wages, as well as the cost of basic living expenses and the level of community resources in each county.

ECONOMIC VIABILITY DASHBOARD

In addition to shifting labor market conditions, the financial stability of ALICE households depends on local conditions. The Economic Viability Dashboard is composed of three indices that evaluate the local economic conditions that matter most to ALICE households – the Housing Affordability Index, the Job Opportunities Index, and the Community Resources Index. The Dashboard reports how each county performs on the three dimensions; the ideal for a county is to have Good conditions in all three indices.

By comparing counties, the Economic Viability Dashboard offers a way to better understand why so many households struggle to achieve basic economic stability throughout New York – and why that struggle is harder in some parts of the state than in others.

Economic Viability Dashboard Scores

The cumulative Dashboard results are presented in the color-coded map of New York’s counties in Figure 35, and the detailed index results are presented in the table in Figure 36. Full results, as well as the methodology and sources, are in Appendix F. Index scores for each county range from a possible 1 (worse economic conditions for ALICE) to 100 (better conditions). Each county’s score is relative to other counties in New York. A score of 100 does not necessarily mean that conditions are very Good; it means that they are better than in other counties in the state. The indices are used only for comparison within the state, not for comparison to other states. They also provide the means to see changes over time within New York.

ALICE households have to navigate a range of variables, and the Economic Viability Dashboard, using the best available proxies, shows them clearly. A common challenge is to find job opportunities in the same counties that are affordable places for ALICE households to live. In addition, many affordable counties do not offer key community resources such as access to quality schools, high levels of health coverage, and the types of community engagement that create social capital. The ideal locations are those that offer affordable housing, job opportunities, and high levels of community resources.

For ALICE households, those locations are both most needed and hardest to find. The Economic Viability Dashboard shows that only Cayuga, Chemung, and Schuyler counties scored in the highest third on all three indices. At the other end of the spectrum, Bronx, Kings (Brooklyn), and Sullivan counties scored in the lowest third on all three indices (Figure 36).

“ALICE households have to navigate a range of variables, and the Economic Viability Dashboard, using the best available proxies, shows them clearly.”

The Housing Affordability Index

Key Indicators: Affordable Housing Gap + Housing Burden + Real Estate Taxes

The more affordable housing is in a county, the easier it is for a household to be financially stable. In New York, there is wide variation between counties on Housing Affordability scores (Figure 36 and Appendix F). The least affordable counties are Nassau and Rockland counties, each with a score of 14 out of 100; the most affordable is Schuyler County, with a score of 66. Yet even the most affordable counties are well below the possible 100 points. In terms of regions, New York City and its surrounding counties are the least affordable, while the counties farthest north are more affordable.

The three key indicators for the Housing Affordability Index are the affordable housing gap, the housing burden, and real estate taxes.

Affordable Housing Gap Indicator

The first key indicator in the Housing Affordability Index is the affordable housing gap. In a given county, there is a difference between the total number of available renter and owner units and the number of those units that households below the ALICE Threshold can afford while spending no more than one-third of their income on housing. This indicator measures that gap, as a percent of the overall housing stock. This is one of the few indicators that assesses the total housing stock in a county and includes subsidized as well as market-rate units that are affordable to ALICE and poverty households. This is discussed further in Section VI.

The larger the gap, the harder it is for households below the ALICE Threshold to find affordable housing, and for this Index, the lower the score. The average affordable housing gap in New York is an 11 percent shortage in rental and owner housing stock, but there is broad variation between counties. Tompkins County had the lowest gap at less than 4 percent. However, most counties had a gap greater than 10 percent, and three had more than 24 percent: Nassau, Rockland, and Suffolk counties.

Housing Burden Indicator

The second key indicator in the Housing Affordability Index is the housing burden – housing costs that exceed 30 percent of income, as defined by the U.S. Department of Housing and Urban Development (HUD). That standard is based on the premise established in the United States Housing Act of 1937 that 30 percent of income was the most a family could spend on housing and still afford other household necessities (Schwartz and Wilson, 2008).

With many of New York’s metropolitan areas ranking among the least affordable in the country, it is not surprising that many New York households are housing burdened. On average, 55 percent of New York renters pay more than 30 percent of their household income on rent, and 31 percent of owners pay more than 30 percent of their income on monthly owner costs, which include their mortgage. There is wide variation across the state, with the highest housing burden across renters and owners in Bronx County at a rate of 55 percent; the lowest is 22 percent in Schuyler County (American Community Survey, 2014). For the Housing Affordability Index, the housing burden is inversely related so that the greater the housing burden, the less affordable the cost of living and, therefore, the lower the Index score.

“With many of New York’s metropolitan areas ranking among the least affordable in the country, it is not surprising that many New York households are housing burdened.”

Real Estate Taxes Indicator

The third key indicator in the Housing Affordability Index is real estate taxes. While related to housing cost, they also reflect a county's standard of living. Even for renters, real estate taxes raise the cost of housing. The average annual real estate tax in New York is \$3,810, but there is wide variation across counties. Average annual real estate taxes are lowest in Lewis County at \$1,911 and highest in Nassau, Rockland, and Westchester counties at \$10,000 (American Community Survey, 2014). For the Housing Affordability Index, real estate taxes are inversely related so that the higher the taxes, the harder it is to support a household and, therefore, the lower the Index score.

The Job Opportunities Index

Key Indicators: Income Distribution + Unemployment Rate + New Hire Wages

The Job Opportunities Index focuses on job opportunities for the population in general and for households living below the ALICE Threshold in particular. The key indicators for job opportunities are income distribution, the unemployment rate, and new hire wages. The more job opportunities there are in a county, the more likely a household is to be financially stable. There is wide variation in job opportunities across New York: The fewest opportunities are in Bronx County with a score of 37, and the most are in Saratoga County with a score of 72. Because New York's economy has a wide range of industries, from agriculture to advanced manufacturing to utilities and transportation, job opportunities for ALICE workers are spread throughout the state economy. At the high end, the most profitable opportunities are in NYC and its surrounding counties. Many of New York's industries have transformed over time to keep pace with the modern economy; those transitions, though, have caused local unemployment at some times and created new jobs at others (MPI Group, 2013).

Income Distribution Indicator

The first indicator in the Job Opportunities Index is income distribution as measured by the share of income for the lowest two quintiles. The more evenly income is distributed across the quintiles, the greater the possibility ALICE households have to achieve the county's median income, and therefore the higher the Index score. The distribution of income in New York is less equal than in the U.S. overall. Within New York, income is most unequal in New York County (Manhattan), where the lowest two quintiles earn only 7 percent of the income. The highest percentage that these two quintiles earn is 15 percent in Genesee, Hamilton, Jefferson, Saratoga, Schuyler, Washington, and Wyoming counties (American Community Survey, 2014).

Unemployment Rate Indicator

The second indicator in the Job Opportunities Index is the unemployment rate. Having a job is obviously crucial to financial stability; the higher the unemployment level in a given county, the fewer opportunities there are for earning income, and therefore the lower the Index score. In most New York counties, the 2014 unemployment rate was above the national average of 6.2 percent, but there was a wide range across the state. The lowest rate was in Chemung County at 3.9 percent, and the highest was above 11.9 percent in Bronx County (American Community Survey, 2014).

New Hire Wages Indicator

The third indicator in the Job Opportunities Index is the "average wage for new hires" as reported by the Bureau of Labor Statistics (BLS). While having a job is essential, having a job with a salary high enough to afford the cost of living is also important. This

"Because New York's economy has a wide range of industries, from agriculture to advanced manufacturing to utilities and transportation, job opportunities for ALICE workers are spread throughout the state economy."

indicator seeks to capture the types of jobs that are currently available in each county. The higher the wage for new hires, the greater the contribution employment can make to household income and, therefore, the higher the Index score. The average wage for a new hire in New York is \$2,299 per month (or \$13.79 per hour) according to the U.S. Census' Quarterly Workforce Indicators, but there is wide variation between counties. At the low end of the spectrum, new hires in Hamilton County earn \$1,524 per month; at the top of the spectrum, new hires in New York County (Manhattan) can expect to earn more than triple that at \$5,307 per month. This degree of variation reflects the very different economic activity across the state and the kinds of jobs and/or wage levels available (see further discussion in Sections III and VI) (U.S. Census, 2014).

The Community Resources Index

Key Indicators: Education Resources + Health Resources + Social Capital

The Community Resources Index measures the education, health, and social capital resources that are available in a community. These resources are fundamental prerequisites to being able to work and raise a family. The Index focuses on resources that can make a difference in the financial stability of ALICE households in both the short and long terms. It also looks at resources that reflect on a specific locality, rather than those that are available in all communities across the country.

In New York, there is more variation between counties in Community Resources scores than on the other indices. Bronx County, with a score of 20 out of 100, has the fewest community resources; the county with the most is sparsely populated Schuyler County, with a score of 86. More typically, rural counties have fewer community resources.

Education Resources Indicator

The first indicator in the Community Resources Index reflects the level of education resources in each county. Providing public education is a fundamental American value, and education is widely regarded as a means to achieve economic success. Quality learning experiences have social and economic benefits for children, parents, employers, and society as a whole, now and in the future. Early learning in particular enables young children to gain skills necessary for success in kindergarten and beyond. In addition, it enables parents to work, which enhances the family's current and future earning potential. For these reasons, the quality of education available to low-income children could be one of the most important determinants of their future. As a proxy for the level of education resources in a county, the Index uses the percent of 3- and 4-year-olds enrolled in preschool (American Community Survey, 2014). The higher the percentage of the population enrolled in preschool, the higher the Index score.

The average share of 3- and 4-year-olds enrolled in preschool in New York is 51.5 percent, but there is wide variation between counties. Only 24 percent of 3- and 4-year-olds are enrolled in preschool in Madison County, while 77 percent are enrolled in Putnam County. This extreme variation indicates that there are more options for early childhood education in some parts of the state – especially in NYC, with the start of the PreK for All program.

Health Resources Indicator

The second indicator in the Community Resources Index reflects the level of health resources in each county. Health insurance is especially important for people living below the ALICE Threshold who earn more than the Medicaid eligibility level, but not enough to afford the high deductibles of the lowest-cost plans offered through

“Providing public education is a fundamental American value, and education is widely regarded as a means to achieve economic success.”

the Affordable Care Act (ACA); this group does not have the resources to pay for a health emergency. As a proxy for the level of health resources in a county, the Index uses percent of the population with health insurance. The higher the rate of health insurance, the higher the Index score.

With the introduction of the ACA, low-income households have more access to health insurance in New York. However, low-income residents are still less likely to have coverage. Of New Yorkers under age 64 with annual income below 200 percent of the FPL, 12 percent still did not have health insurance in 2014, but for residents under age 64 of all income levels, that rate was only 9 percent (Kaiser Family Foundation, 2014).

The overall level of health insurance coverage in New York increased slightly over the last two decades, from 84 percent in 1994 to 91.3 percent in 2014 (U.S. Census Bureau, 1995; U.S. Census Bureau, 2015). However, coverage rates vary widely across the state today: The lowest health insurance coverage rate is in Yates County at 79.6 percent, and the highest is in Saratoga County at 94.7 percent (American Community Survey, 2014).

Social Capital Indicator

The third indicator in the Community Resources Index reflects the level of social capital in each county. Communities with engaged citizens build the social capital necessary to mobilize resources, improve quality of life, and resolve conflict. The greater the community engagement, the more the community's activities reflect the population's values (Putnam, 1995; National Task Force on Civic Learning and Democratic Engagement, 2012; Saguaro Seminar on Civic Engagement in America, 2000). Participating in electoral and political processes – such as voting, campaigning, attending rallies and protests, contacting officials, or serving on local boards – is one aspect of community engagement. Broader community engagement includes volunteering and contributing with religious, educational, neighborhood, and community organizations.

As a proxy for the level of social capital in a county, the Index uses one of the longest-standing indicators of community engagement – the percent of the adult population who voted in the most recent national election (U.S. Election Assistance Commission, 2014; Hoopes Halpin, Holzer, Jett, Piotrowski, and Van Ryzin, 2012). The higher the proportion of the total population (taking into account the impact of noncitizens) that voted, the greater the community engagement and ability to build social capital in the community, and therefore, the higher the Index score.

The share of voting-age New York residents who voted in the 2012 presidential election was 53 percent, slightly below the national average of 58 percent. This is much higher than the 2014 mid-term election rate of 29 percent in New York (United States Elections Project, 2014; United States Elections Project, 2015). There is also great variation across the state: In Bronx and Queens counties, only 13 percent of residents voted, while 78 percent voted in Schuyler County (United States Election Assistance Commission, 2014; American Community Survey, 2014).

Changes Over Time

The Economic Viability Dashboard enables comparison over time for the three dimensions that it measures. To visualize changes over time, the average scores for all counties in New York on each Index are presented in Figure 37. With 2010 as the baseline for each Index, the score for each is 50. Scores in 2007, 2012, or 2014 that are above 50 show better conditions than in 2010; scores below that level represent conditions that have worsened. In measuring change over time, complete data was not available for two smaller counties, Hamilton and Schuyler, out of 62 total counties.

“The overall level of health insurance coverage in New York increased slightly over the last two decades, from 84 percent in 1994 to 91.3 percent in 2014.”

The changes in Dashboard scores from 2007 to 2014 illustrate the changing conditions in New York over the course of the Great Recession and after. Both housing affordability and job opportunities worsened during the Great Recession. Conditions for housing affordability have continued to decline slightly. Conditions for job opportunities have improved since 2010 but have not returned to their 2007 levels.

For most of the latter half of the 20th century, housing prices increased steadily. This trend reached its peak around 2005, then abruptly ended with the housing market crash that led to the Great Recession. Since then, housing prices have declined in New York and most of the U.S., causing financial strain for many but making housing more affordable for others (Public Policy Center, 2010). In New York, housing affordability fell by 2 percent from 2007 to 2010, then stabilized from 2010 to 2012, but fell another 1 percent between 2012 and 2014.

Job opportunities fell by 11 percent from 2007 to 2010 and then by another 3 percent in the two years following the technical end of the Recession. More recently, from 2012 to 2014, they increased by 10 percent, almost returning to 2007 levels. However, it is still too soon to tell if this will be a long-term trend.

Community resources fluctuated between 2007 and 2014. They increased by 1 percent during the Great Recession, then spiked between 2010 and 2012, rising 28 percent. The spike in 2012 was due to high voter turnout for the presidential election. Following the election-related increase, they fell by 18 percent, but remained 6 percent higher than 2007 levels. Community resources – including health care, early childhood education, and social capital – are important to ALICE households. The research is not clear on whether these factors lead to or result from better economic conditions. But the fact that their improvement has preceded signs of economic recovery in other states suggests that they support the needs of ALICE households while those households wait for market-driven forces, such as jobs and housing, to catch up. It is still too early to tell if this is the case in New York.

“Both housing affordability and job opportunities worsened during the Great Recession. Conditions for housing affordability have continued to decline slightly. Conditions for job opportunities have improved since 2010 but have not returned to their 2007 levels.”

Figure 37.
Economic Viability Dashboard, New York, 2007 to 2014

Source and Methodology: See Appendix F

“Of the 50 largest commuting zones in the U.S., New York, NY is ranked sixth in the probability that a child born to a family in the bottom quintile of the national income distribution will ultimately reach the top quintile.”

Comparison with Other Indices

THE HUMAN DEVELOPMENT INDEX

A project of the Social Science Research Council, this Index measures health (life expectancy), education (school enrollment and the highest educational degree attained), and income (median personal earnings) for each state in the U.S. Of all the states, New York ranks eighth in social and economic development, driven primarily by the state’s high education attainment, life expectancy, and median earnings (Lewis and Burd-Sharps, 2014).

BE THE CHANGE’S OPPORTUNITY INDEX

This Index measures the degree of opportunity – now and in the future – available to residents of each state based on measurements of that state’s economic, educational, and community health. New York ranks 15th overall and scores slightly above average on the economy and community measures, while slightly below average on the education measure. This Index also breaks down opportunity scores by county (Opportunity Nation, 2015).

THE INSTITUTION FOR SOCIAL AND POLICY STUDIES’ ECONOMIC SECURITY INDEX

This Index measures not conditions, but changes – the size of drops in income or spikes in medical spending and the corresponding “financial insecurity” level in each state based on the percentage of the population that lost a quarter of their income within the year. New York residents face more financial insecurity than the national average, scoring 21.6 between 2008 and 2010. Like the national average, the scores in New York improved since 2010, falling to 20 in 2012 (Hacker, Huber, Nichols, Rehm, and Craig, 2012).

THE GALLUP-HEALTHWAYS WELL-BEING INDEX

This Index provides a view of life in New York at the state level in terms of overall well-being, life evaluation, emotional health, physical health, healthy behavior, work environment, and feeling safe, satisfied, and optimistic within a community. Overall, New York has scored below the national average and ranks 40th. The state ranks 17th in physical well-being but lower in all other elements, with the third-worst rank for community pride and safety (Gallup-Healthways, 2015).

THE NATIONAL ASSOCIATION OF HOME BUILDERS (NAHB)/WELLS FARGO HOUSING OPPORTUNITY INDEX

This Index measures the share of homes sold in a given area that would be affordable to a family earning the local median income, based on standard mortgage underwriting criteria. New York’s 12 metropolitan areas rank from the fourth most affordable area in the nation (Binghamton, NY) to the 222nd (New York-Jersey City-White Plains, NY-NJ) out of 225 metro areas (NAHB/Wells Fargo, 2015).

THE INTERGENERATIONAL MOBILITY INDEX

Developed by the Equality of Opportunity project at Harvard University, this Index focuses on metro areas, measuring the upward mobility of children from low-income families. Of the 50 largest commuting zones in the U.S., New York, NY is ranked sixth in the probability that a child born to a family in the bottom quintile of the national income distribution will ultimately reach the top quintile (Chetty, Hendren, Kline, and Saez, 2014).

THE HUMAN NEEDS INDEX

Developed by the Indiana University Lilly Family School of Philanthropy and the Salvation Army, this Index is based on the services that the Salvation Army provides (clothing, food, basic medical care, and shelter). In 2014, New York scored 1.1 in the composite index of poverty-related need and the impact of Salvation Army services. The national average was 1.97; zero represents the minimum level of need (Indiana University Lilly Family School of Philanthropy, 2015).

VI. THE CONSEQUENCES OF INSUFFICIENT HOUSEHOLD INCOME

When households face difficult economic conditions and cannot afford basic necessities, they are forced to make difficult choices and take costly risks. When the overall economic climate worsens, as it did from 2007 to 2010 during the Great Recession, many households have to make even harder trade-offs; the same is true when families are faced with emergencies and unexpected expenses. Many of New York’s ALICE households have depleted their savings and are still having trouble finding higher-wage jobs four years after the end of the Great Recession. This section reviews the strategies that they use to survive.

For ALICE households, difficult economic conditions create specific problems in the areas of housing, child care and education, food, transportation, and health care, as well as income and savings. **Yet what is not always acknowledged is that these problems have consequences not just for ALICE households, but for their broader communities as well.**

The choices that ALICE households are forced to make often include skipping health care, accredited child care, healthy food, or car insurance. While these “savings” have direct impacts on the health, safety, and future of these households, their wider effects can include reducing New York’s economic productivity and raising insurance premiums and taxes for everyone (Figure 38).

“When households face difficult economic conditions and cannot afford basic necessities, they are forced to make difficult choices and take costly risks.”

Figure 38.
Consequences of Households Living below the ALICE Threshold in New York

	Impact on ALICE	Impact on Community
HOUSING		
Live in substandard housing	Health and safety risks; increased maintenance costs; inconvenience	Increased health care costs; worker stressed, late, and/or absent from job – less productive
Move farther away from job	Longer commute; costs increase; severe weather can affect commuter safety; less time for other activities	More traffic on road; workers late to job; absenteeism due to severe weather can affect community access to local businesses and amenities; increased cost of urban sprawl including infrastructure and services such as roads, public transit, sewage, etc.
Homeless	Disruption to job, family, school, etc.	Costs for homeless shelters, foster care system, health care
CHILD CARE AND EDUCATION		
No child care	One parent cannot work; forgoing immediate income and future promotions	Future need for education and social services
Substandard public education	Learning risks; limited earning potential/ mobility; limited career opportunity	Stressed parents; lower-skilled workforce; future need for social services

	Impact on ALICE	Impact on Community
FOOD		
Less healthy	Poor health; obesity	Less productive worker/student; increased future demand for health care
Not enough	Poor daily functioning	Even less productive; increased future need for social services and health care
TRANSPORTATION		
Old car	Unreliable transportation; risk of accidents; increased maintenance costs	Worker stressed, late, and/or absent from job – less productive
No insurance/ registration	Risk of fine; accident liability; risk of license being revoked	Higher insurance premiums; unsafe vehicles on the road
Long commute	Costs increase; severe weather can affect commuter safety; less time for other activities	More traffic on road; workers late to job; increased demand for road maintenance and services
No car	Limited employment opportunities and access to health care/child care	Reduced economic productivity; higher taxes for specialized public transportation; greater stress on emergency vehicles
HEALTH CARE		
Underinsured	Delaying or skipping preventative health care; more out-of-pocket expense; substandard or no mental health coverage	Workers report to job sick; spread illness; increased workplace issues due to lower productivity and greater absenteeism
No insurance	Forgoing preventative health care; use of emergency room for non-emergency care	Higher premiums for all to fill the gap; more expensive health costs; risk of health crises
INCOME		
Low wages	Longer work hours; pressure on other family members to work (drop out of school); no savings; use of high-cost alternative financial products	Worker stressed, late, and/or absent from job – less productive; higher taxes to fill the gap
No wages	Cost of looking for work and finding social services; risk of depression	Less productive society; higher taxes to fill the gap
SAVINGS		
Minimal savings	Mental stress; crises; risk taking; use costly alternative financial systems to bridge gaps	More workers facing crises; unstable workforce; community disruption
No savings	Crises spiral quickly, leading to homelessness, hunger, illness	Costs for homeless shelters, foster care system, emergency health care

HOUSING

Housing is the cornerstone of financial stability, and as such, its relatively high cost often forces ALICE households into difficult situations. Homelessness is the worst possible outcome when ALICE cannot afford basic housing, but there are lesser consequences that still take a toll, including excessive spending on housing, living far from work, or living in substandard units. Finding convenient housing that is affordable is challenging for low-wage workers in many parts of New York. A growing population and changing demographics have increased the demand for an already tight supply of smaller, low-cost housing units, especially rental units. In addition, the most recent economic challenges in New York have cost many homeowners the equity in their homes and even forced some into foreclosure.

The first and most common way ALICE households deal with these challenges is by paying more for housing than they can afford. Throughout the state, housing remains the most expensive budget item in all counties for all households except those with two or more children in child care. In the National Association of Home Builders (NAHB)/Wells Fargo Housing Opportunity Index, which ranks homeownership affordability, the New York City metropolitan area is the 219th most affordable area in the nation (out of 225) and 44th in the Northeast (out of 44). On the other end of the spectrum, the Syracuse metro area is the third most affordable metro area in the nation and first in the region (NAHB/Wells Fargo, 2015) (Figure 39).

“A growing population and changing demographics have increased the demand for an already tight supply of smaller, low-cost housing units, especially rental units.”

Figure 39.

Syracuse	3	1	4%	-3%

Source: NAHB/Wells Fargo Housing Opportunity Index, 2014

“When households with income below the ALICE Threshold spend more than 30 percent of income on rent and utility costs, they are often forced to forgo other basics, such as food, medicine, child care, or heat.”

Affordability has changed over time, falling in the southern portion of the state, especially through the Great Recession, while improving in the Rest of State. The median house price fell by more than 14 percent in the Poughkeepsie-Newburgh-Middletown, Kingston, Nassau-Suffolk, and New York-White Plains-Wayne, NY-NJ metro areas from 2007 to 2010. It then improved slightly only for Nassau-Suffolk and New York-White Plains-Wayne, NY-NJ from 2010 to 2014. At the same time, all other regions experienced a positive change in median house price from 2007 to 2014, with Elmira, Glens Falls, and Ithaca experiencing more than a 20 percent gain (NAHB/Wells Fargo, 2015).

Another indicator of the lack of housing affordability in the state is the extent to which households are housing burdened. As discussed in Section V, 55 percent of New York renters paid more than 30 percent of their household income on rent, and 31 percent of owners paid more than 30 percent of their income on monthly owner costs, which included their mortgage, in 2014. Owners and renters with lower incomes are more likely to be housing burdened than those with higher incomes (American Community Survey, 2012 and 2014). When households with income below the ALICE Threshold spend more than 30 percent of income on rent and utility costs, they are often forced to forgo other basics, such as food, medicine, child care, or heat (National Low Income Housing Coalition (NLIHC), 2015; MacArthur Foundation, 2015).

Finding lower-cost housing is a second strategy for ALICE families, but those who pay less face a range of problems that accompany lower-cost units. Many housing units cost less because they are in undesirable locations – areas with high crime rates, run-down infrastructure, no public transportation, or long distances to grocery stores, public services, and other necessities. Families also often face a trade-off between spending money on housing or on transportation: Harvard University’s Joint Center for Housing Studies estimates that in 2014, low-income households living in affordable housing (spending 30 percent of their income or less on housing) spent nearly three times more on transportation than households with severe burdens (those spending more than 50 percent of their income) (Joint Center for Housing Studies of Harvard University, 2016).

Finally, ALICE families in New York often live in substandard units that present a variety of health and safety risks. These range from lack of basic heating and plumbing to exposure to lead, mold, and other toxins, which can increase demand – and costs – for health care services. In addition, lower-cost housing is often older, and older units are more likely to need maintenance and costly repairs. On average New York’s housing stock is older than in the rest of the country, with 56 percent of housing units built before 1960, well above the U.S. average of 29 percent. The oldest units, those built before 1940, account for approximately 32 percent of the state’s housing stock (American Community Survey, 2014).

Of the state’s low-cost housing stock, 31,057 units lack complete plumbing facilities and 55,145 lack complete kitchen facilities (American Community Survey, 2014). Low-rent housing often needs maintenance, so ALICE families face the additional cost of upkeep as well as the safety risks of do-it-yourself repairs, or possibly greater risks when repairs are not made. A costly repair can threaten the safety or livelihood of an ALICE household (Joint Center for Housing Studies of Harvard University, 2016; MacArthur Foundation, 2015; Coley, Leventhal, Lynch, and Kull 2013).

Overall, with very low vacancy rates statewide – 2 percent for homeowners and 4 percent for renters – New York residents are more likely to face problems of higher costs, or poor housing conditions for lower-cost units (American Community Survey, 2014).

Renters

ALICE households are more likely to be renters than owners in New York, occupying 63 percent of all rental units. The national housing crisis and the Recession led to an increase in the demand for rental housing in New York. The percentage of total households renting in the state increased from 44 percent in 2007 to 47 percent in 2014 (American Community Survey, 2014).

Yet renting has distinct downsides. First, as mentioned above, renters are more likely than owners to face a housing burden. While this is a problem across the state, it is particularly severe in NYC, where 56 percent of renters are housing burdened. Second, while renting offers greater mobility, allowing people to move more easily for work, and renters are more likely than homeowners to have moved in the last few years, there are associated expenses (American Community Survey, 2014). Any move has a range of costs, from financial transition costs and reduced wages due to time off from work to social start-up costs for new schools and the process of becoming invested in a new community. Finally, and perhaps most importantly, renters are not able to build equity in a home (American Community Survey, 2012; West, 2015).

Analysis of the housing stock in each county in New York reveals that the available units do not match current needs. According to housing and income data that roughly aligns with the ALICE dataset, there are 2.1 million renters with income below the ALICE Threshold, yet there are fewer than 1.7 million rental units – subsidized and market-rate – that these households can afford without being housing burdened (Figure 40). Using high and low estimates, New York would need between 471,893 and 590,363 more lower-cost rental units to meet the demand of renters below the ALICE Threshold. This assumes that all ALICE and poverty households are currently living in rental units they can afford. But the number of households that are housing burdened reveals that this is often not the case in New York, so the assessment of need for low-cost rental units across the state is in fact a low estimate.

Using a different methodology, the NLIHC estimates a shortage of 627,684 units in New York that are affordable and available for extremely low-income renters, based on affordability to residents earning less than 30 percent of the median income (National Low Income Housing Coalition, March 2015). Despite using different parameters, the NLIHC and ALICE estimates both confirm the significant shortage of affordable rental units in New York.

“The national housing crisis and the Recession led to an increase in the demand for rental housing in New York. The percentage of total households renting in the state increased from 44 percent in 2007 to 47 percent in 2014.”

Figure 40.

Renters below the ALICE Threshold vs. Rental Stock, New York, 2014

Source: American Community Survey, 2014, and the ALICE Threshold, 2014

“According to the Corporation for Economic Development, New York is among the bottom five states in homeownership affordability based on the ratio of median housing value to median income.”

Subsidized housing units are an important source of affordable housing for ALICE families. Of the nearly 1.7 million rental units that households with income below the ALICE Threshold can afford across the state, approximately 36 percent are subsidized: New York’s affordable rental housing programs reached 601,834 households across the state in 2014 (HUD, 2014).

The majority of rental units in the state (63 percent) are located in NYC, as are 57 percent of renters with income below the ALICE Threshold. Following the need, 65 percent of subsidized units are located in NYC. The need for subsidized units is apparent in the small supply of market-rate affordable housing units, which account for only 31 percent of all rental units across the state (and an even smaller share in NYC).

Across the state, most renters continue to spend large portions of their income on housing. In New York, the estimated mean wage for a renter in 2014 was \$21.81 per hour. At this wage, in order to afford the Fair Market Rate (FMR) for a two-bedroom apartment without becoming housing burdened, a renter would have to work 124 hours per week, 52 weeks per year (NLIHC, 2014).

Homeowners

According to the Corporation for Economic Development, New York is among the bottom five states in homeownership affordability based on the ratio of median housing value to median income (Corporation for Economic Development, 2016). For this reason, it is not surprising that only 37 percent of the state’s households with income below the ALICE Threshold are homeowners. There would be enough affordable units for them (defined as those that do not consume more than one-third of their income) if all homeowners had a 30-year mortgage at 4 percent for 90 percent of the value of the house or better. But the fact that 34 percent of New York households with a mortgage are housing burdened suggests that many homeowners were not able to get competitive financing rates, that they put less than 10 percent down, or that they were not able to find units that were affordable. The increase in the number of renters also reflects these challenges.

ALICE families that own their homes are more likely than higher-income families to have a sub-prime mortgage. Almost by definition, most sub-prime mortgages are sold to low-income households, and now these households make up the majority of foreclosures. An additional factor in foreclosure is often property tax: when rates increase faster than wages or the value of the home, homeowners may be burdened with additional expense that they cannot manage. In 2014 there were 43,868 foreclosure cases filed in New York, up significantly from 16,772 in 2011 but still below the peak of 47,824 in 2009. The 2015 foreclosure inventory rate was 3.7 percent, considerably higher than the average U.S. historic level of 1.1 percent. Rates vary across the state: The counties surrounding NYC have the greatest number of pending foreclosures with rapid growth from 2013 to 2015, and the Rest of State also saw growth in pending cases. NYC, by contrast, had a drop of nearly 10 percent during the same time period (CoreLogic, 2013; CoreLogic, 2015; Marks, 2015; RealtyTrac, 2016; New York State Office of the State Comptroller, 2015).

For an ALICE household, a foreclosure not only results in the loss of a stable place to live and an owner’s primary asset but also reduces the owner’s credit rating, creating barriers to future home purchases and rentals. With few or no other assets to cushion the impact, ALICE households recovering from foreclosure often have difficulty finding new housing (Bernanke, 2008; Kingsley, Smith, and Price, 2009; Frame, 2010).

In addition, with the tightening of mortgage regulations, those who do not qualify for traditional mortgages look for alternatives, leading to an increased use of “contract for deed” or “rent-to-own” mortgages that charge higher interest rates and have less favorable terms for borrowers. The need for such services is reflected in the growth of this industry nationally, and

in New York, 3 percent of the total population and 8 percent of unbanked households have used a rent-to-own financial product (FDIC, 2014; Anderson and Jaggia, 2008; Edelman, Zonta, Gordon, 2015; Kusisto, 2015).

Homelessness

Ultimately, if an ALICE household cannot afford their home or it becomes too unsafe and has to be vacated, they can become homeless. This starts a downward spiral of bad credit and destabilized work, school, and family life. Some households move in with relatives, threatening the stability of another household. Others rely on homeless services, like rehousing, emergency shelter, and transitional housing, adding to government costs.

In New York in 2014, there were 80,590 people counted as homeless on a single night, including 2,542 veterans. The state's rate of 41 homeless people per 100,000 residents is much higher than the national rate of 18.3 per 100,000. Overall, more than one-quarter of those who are homeless in New York are homeless as part of a family (National Alliance to End Homelessness, 2015).

Broader Consequences for Housing in New York

When ALICE families cannot afford safe housing near where they work, there are consequences for the whole community. When workers pay more for housing, they have less to spend on other goods and services in the community. They may not have enough resources to maintain their homes, which impacts entire neighborhoods. If they are forced to move due to cost or foreclosure, that adds instability to their neighborhoods. And ultimately, if a family becomes homeless, there are additional costs that the wider community absorbs.

The evidence is clear that keeping a family housed is significantly less expensive than caring for a homeless family or returning them to a home – one-sixth the cost, according to the Office of the Inspector General of the U.S. Department of Health and Human Services. The U.S. Department of Housing and Urban Development (HUD) finds that nationally, the average cost of services for homeless individuals ranges from \$1,634 to \$2,308 per month, and for families, from \$3,184 to \$20,031 per month (Spellman, Khadduri, Sokol, and Leopold, March 2010).

Philip Mangano, former executive director of the U.S. Interagency Council on Homelessness, reports that **the cost of having people on the street ranges from \$35,000 to \$150,000 per person per year, while the cost of keeping formerly homeless people housed ranges from \$13,000 to \$25,000 per person per year**, based on data from 65 U.S. cities (Mangano, 2008). The highest numbers are for chronically homeless people, who are the most vulnerable and disabled. Expenses include temporary housing as well as crisis services such as emergency room treatment, substance abuse and mental health care, and police and court costs.

Future Prospects

The cost of housing in New York will continue to be a drain on the Household Survival Budget. Based on forecasted economic and demographic changes, significantly more households will be in need of smaller, lower-cost housing over the next two decades, adding to the demand for additional affordable housing options. These trends include the decline in the rate of homeownership (down 3.8 percentage points from 2004 to 2014), the decrease in household size, the flat level of incomes for renters, and the changing demands of seniors as well as young workers (Federal Reserve Bank of St. Louis, 2014, Paulsen, 2015).

“Based on forecasted economic and demographic changes, significantly more households will be in need of smaller, lower-cost housing over the next two decades, adding to the demand for additional affordable housing options.”

“The consequences for a family of not having child care are twofold: The child may not gain pre-learning skills necessary for success in kindergarten and beyond, and one parent has to forgo work, limiting both current income and future earning potential.”

In general, rental housing units – especially those that are older and in poor condition – are also vulnerable to removal or to damage and destruction. Nationally, 5.6 percent of the rental stock was demolished between 2001 and 2011, but the loss rate for units with rent under \$400 per month (i.e., those most affordable for ALICE households) was more than twice as high, at 12.8 percent (Joint Center for Housing Studies of Harvard University, 2013). The removal of these units, inexpensive and unsafe as they may have been, puts additional pressure on the remaining rental stock, increasing costs for all renters.

Homeownership continues to elude many workers, especially in New York. Nationally, the two most common reasons renters cite for renting rather than owning a home are that they don’t think they can afford the necessary down payment (50 percent of respondents) or they don’t think that they will qualify for a mortgage (31 percent), according to the Federal Reserve’s Survey of Household Economics and Decisionmaking in 2014 (Federal Reserve, 2015). Because homeownership has been the most common vehicle for families to build savings, the shift towards renting and away from homeownership may leave those families without the assets needed for retirement or education, or to draw upon in an emergency. This, in turn, stands to increase the number of ALICE households in the future.

The ability to drastically change the housing stock in New York is constrained by geography, economics, and, in some places, zoning laws that limit the potential for new small or low-cost housing units to be built in economically prosperous areas. Given this combination of factors, many ALICE households will continue to live farther away from their jobs or in unsafe units, resulting in the associated challenges and costs (Prevost, 2013).

CHILD CARE AND EDUCATION

Education is one of the few ways ALICE families can get ahead in the long run. In the short-term, it is a challenge to find quality, affordable child care, strong public schools, and affordable higher education. As a result, ALICE families often forgo educational opportunities, with consequences both for their earning potential and for the development of human capital in their communities.

Quality, Affordable Child Care

Quality, affordable child care is one of the most important – and most expensive – budget items for ALICE families. The consequences for a family of not having child care are twofold: The child may not gain pre-learning skills necessary for success in kindergarten and beyond, and one parent has to forgo work, limiting both current income and future earning potential. As discussed in Section II, child care in New York is often the most expensive item in the Household Survival Budget. The average cost of registered home-based child care is \$706 per month for an infant in New York, and the cost for a 4-year-old is \$657 per month. By comparison, the average cost of a licensed, accredited child care center for an infant is 34 percent more (New York State Office of Children & Family Services, 2014).

To get a sense of the types of child care that families use, the U.S. Census reports that nationally in 2011, 42 percent of preschoolers were in a regular child care arrangement with a relative, 24 percent were in an organized care facility, 11 percent were in another non-relative care arrangement, and 25 percent had no regular child care arrangement. Since the mid-1980s, the biggest changes in child care arrangements for working mothers have been the decline in non-relative care (falling from 28 percent to 13 percent in 2011) and the increased use of organized day care centers and father care (Laughlin, 2013). In New York, 58 percent of 3- and 4-year-olds are enrolled in early childhood education, the fifth-highest rate in the country (Corporation for Enterprise Development, 2016).

In an attempt to save money or because they lack other available child care options, ALICE parents may use unlicensed, home-based child care or even rely on friends and neighbors in formal and informal ways. In New York, all organized care facilities must be licensed by the Office of Children and Family Services. Unlicensed, home-based child care, while often less expensive, is not fully regulated, so the safety, health, and learning quality of home-based care can vary greatly and are not guaranteed (Child Care Aware of America, 2014).

Some child care needs can be covered by publicly subsidized preschools, which provide great savings to ALICE families. In New York, state preschool programs enroll more than 170,000 children. The state ranks 22nd nationally in terms of spending per preschool student, at \$3,820 per year. In terms of quality, one of New York's programs, Universal Pre-Kindergarten (UPK), provides tuition reimbursement for qualifying programs to 98,910 children and meets 7 of the 10 benchmarks for state pre-K quality standards set by the National Institute for Early Education Research (NIEER). In 2014, New York City established Pre-K for All, expanding public pre-kindergarten classes to enroll 51,500 4-year-olds, up from 20,000 in 2013. With these programs, enrollment in pre-K for 4-year-olds across the state increased from 25 percent to 44 percent from 2002 to 2014 (NIEER, 2014; Lucadamo, 2016; City of New York, 2014).

From 2012 to 2014 in New York, 58 percent of children ages 3 and 4 attended preschool, above the national average of 46 percent. However, attendance at preschool is strongly related to income, and children in households with higher incomes are more likely to attend. In New York, 51 percent of children in households with income below 200 percent of the Federal Poverty Level were enrolled in preschool between 2012 and 2014 (Annie E. Casey Foundation, 2014).

The Achievement Gap

One area of particular concern for New York's ALICE households is the achievement gap in the state's public schools. Across the state, students of color and low-income students performed lower on test scores throughout K-12 and had lower high school graduation rates than their White or higher-income counterparts.

In terms of overall student achievement, New York is ranked ninth in the U.S. in Education Week's Quality Counts report. According to the most recent data, only 36 percent of fourth graders in New York were proficient in reading, slightly above the national average of 35 percent. In eighth grade math, only 31 percent of New York students were proficient, versus a national average of 32 percent, according to the 2015 New York National Assessment of Educational Progress (NAEP) assessment (Education Week Research Center, 2016; Education Week Research Center, 2016a).

New York's statewide public high school graduation rate was 77 percent – slightly lower than the national average of 81 percent – in 2012, the latest year for which federal data is available. However, the rates were significantly lower for economically disadvantaged students (68 percent), those with disabilities (48 percent), and those with limited English proficiency (44 percent). Rates also vary markedly by race and gender: For the 2012-2013 school year, the state's graduation rate was 57 percent for Black and Latino males and 85 percent for White males (Stetser and Stillwell, 2014; Education Week Research Center, 2016a; Schott Foundation for Public Education, 2015).

Achievement gaps also exist across geographies in New York, particularly between NYC and the rest of the state. NYC's 2015 standardized test results for grades 3 through 8 lagged behind the rest of the state. Just over 31 percent of NYC students were proficient in English, compared to 32.5 percent in the rest of the state. The gap in math was larger – 37.1 percent in NYC versus 40.5 percent in the rest of the state (New York City Independent Budget Office, 2016). These gaps have not decreased with the introduction of the Common Core curriculum and the expansion of standardized testing (Felton and Butrymowicz, 2015).

“One area of particular concern for New York's ALICE households is the achievement gap in the state's public schools.”

“Nationally, the difference in earnings over a lifetime between high school graduates and those who hold a bachelor’s degree is estimated to be \$830,800.”

Broader Consequences for Child Care and Education in New York

Quality learning experiences have social and economic benefits for children, parents, employers, and society as a whole, now and in the future. Early learning in particular enables young children to gain skills necessary for success in kindergarten and beyond. In addition, it enables parents to work, which enhances the family’s current and future earning potential.

The value of quality child care – for children, their families, and the wider community – is well documented. **Alternatively, poor quality child care can slow intellectual and social development, and low standards of hygiene and safety can lead to injury and illness for children.** Inadequate child care also has wider consequences: It negatively affects working parents and employers, resulting in absenteeism, tardiness, and lower productivity on the job (Alliance for Excellent Education, 2011 and 2013; Haskins, 2011; Childhood Trends, 2011; McCartney, 2008).

The evidence is clear on the importance of needing, at a minimum, a solid high school education in order to achieve economic success. Nationally, the difference in earnings over a lifetime between high school graduates and those who hold a bachelor’s degree is estimated to be \$830,800. The difference in earnings between high school graduates and those with an associate’s degree is estimated at \$259,000. And estimates of the difference in the net earnings of a high school graduate versus a high school dropout range from \$260,000 to \$400,000 when including income from tax payments minus the cost of government assistance, institutionalization, and incarceration (Carnevale, Rose, & Cheah, 2011; Center for Labor Market Studies, 2009; Daly and Bengali, 2014; Klor de Alva and Schneider, 2013; Tyler and Lofstrom, 2009).

The lack of a basic education has repercussions society-wide as well, including lower tax revenues, greater public spending on public assistance and health care, and higher crime rates. Closing the education achievement gap would be economically beneficial not only for lower-income individuals and families but for all New York residents.

Future Prospects

The importance of high-quality child care and public education remains a fundamental American value, but ALICE households are challenged to find quality, affordable education at all levels in New York. From child care through high school, the state’s current facilities do not match the existing need, creating several important consequences for the New York economy. Reworking public education to address the achievement gap takes significant financial resources, and if the gap is not addressed, the state economy forgoes local talent. In order for New York’s economy to continue to grow and sustain an aging population, the state must also then continue to attract workers from other states and abroad. An education system that works for all residents would be an important draw.

Education is also important for communities; people with lower levels of education are often less engaged in their communities and less able to improve conditions for their families. More than half of those without a high school diploma report not understanding political issues while 89 percent of those with a bachelor’s degree have at least some understanding of political issues. Similarly, having a college degree significantly increases the likelihood of volunteering, even controlling for other demographic characteristics (Baum, Ma, and Payea, 2013; Campbell, 2006; Mitra, 2011).

Overall, New York’s education system produces the 17th-highest rate of a “Chance for Success” out of the 50 states in the U.S., according to Education Week’s Quality Counts report (Education Week Research Center, 2015).

Child Care

The need for child care in New York is clear given that 88 percent of all New York families with children had all available parents in the workforce in 2013 – the same as the national average (Working Poor Families Project, 2013). With the extensive involvement of parents in the workforce, child care is an issue for virtually all New York families, and high costs make finding quality care even more challenging for parents in low-wage jobs.

Economic trends may make it harder to find and afford quality child care in New York in the future. From 2010 to 2012, the number of registered family daycare and school-age providers in New York – the more affordable type of organized child care – declined 6 percent. At the same time, the number of center-based child care programs – which are more expensive – increased 2 percent. While almost half of these programs are in NYC, the trends are the same in the city and across the state. Combined with the limited availability of public preschool, especially in the Rest of State, these trends mean that there will be more parents across the state who must forgo work or advancement, and more children who may not be fully school-ready by kindergarten (New York State Office of Children and Family Services; New York State Education Department, 2014).

For many small businesses, there is a dual challenge when ALICE is both the employee and the customer, and child care is one example. There were 77,143 child care establishments in New York in 2014, of which 71,698 were sole proprietors (family child care home operators) and 5,445 were child care centers. Child care workers are ALICE; there were 50,640 child care workers in New York in 2014, earning an average wage of \$12.07 per hour (\$24,140 annually if full time). The phasing in of the new minimum wage in New York will increase wages for these workers. However, ALICE families use child care so that they themselves can work, and it can be the most expensive item in ALICE's budget – even more expensive than housing. The conundrum is that if the wages of child care employees increase, those expenses are passed on to customers, who themselves are often ALICE. ALICE child care workers will earn more, but child care will become more expensive for ALICE families (Bureau of Labor Statistics, 2014; Committee for Economic Development, 2015).

“For many small businesses, there is a dual challenge when ALICE is both the employee and the customer, and child care is one example.”

K-12 and Beyond

In school districts across the country, one response to the persistence of the achievement gap and the perception that public schools have not met the needs of many students has been the creation of charter schools. The ability of charter schools to improve school performance and close the achievement gap for students of color and low-income students is the subject of nationwide debate. There are 295 charter schools out of 4,471 public schools in New York, and more than half of them are located in NYC. While charter schools have not eliminated the achievement gap, many schools have made gains, especially for students of color who are in poverty, with more pronounced improvements in math than in reading (New York State Education Department, 2016; Center for Research on Education Outcomes, 2013).

In terms of K–12 and higher education preparing students for jobs, the state faces two major challenges: job creation, and the reduction in jobs requiring higher education. Education has traditionally been the best guarantee of higher income, and the two are still strongly correlated. Yet short- and long-term factors may be changing the equation, especially for ALICE households. Longer-term structural changes have limited the growth of medium- and high-skilled jobs, changing the need for education as well as the incentives to pursue higher education and take on student debt.

In addition, college tuition has increased beyond the means of many ALICE households and burdened many others. In New York's Class of 2014, 61 percent graduated with an average of \$27,822 in student debt – the 19th-highest debt level in the country – and more than 8 percent of those students defaulted on their loans within 3 years (Project on Student Debt, 2015; Corporation for Economic Development, 2014). As national research by the Federal Reserve reveals, this debt burden jeopardizes the short-term financial health of younger households: **The median net worth for households with no outstanding student loan debt is nearly three times higher than for households with outstanding student loan debt** (Elliott and Nam, 2013).

Because college graduates have greater earning power, more Americans than ever before are attending college, but at the same time, more are dropping out and defaulting on their loans. More than 70 percent of Americans matriculate at a four-year college – the seventh-highest rate among 23 developed nations for which the Organisation for Economic Co-operation and Development (OECD) compiles such statistics. But less than two-thirds of matriculating Americans end up graduating; when including community colleges, the graduation rate drops to 53 percent (OECD, 2015).

The proliferation of for-profit schools and, to a lesser extent, two-year institutions during and after the Recession has hurt the economic prospects of many students. These schools include online universities, certificate-granting institutions, technical schools, and community colleges, with a wide range of credentials and tuition costs. Not all, but many of these schools targeted low-income and non-traditional students – older, independent, and those already struggling in the job market – who financed their educations largely through federal student loans. Many of these students subsequently dropped out of their programs, and as a result face poor job prospects and loan distress (Cellini, 2009; Deming, Goldin, & Katz, 2012).

Almost 20 percent of non-traditional borrowers were unemployed three years after leaving school, and those who did have jobs earned about 20 percent less than their peers. Those circumstances, a lack of family financial resources, and high debt burdens relative to income drove these students' default rates up precipitously. By 2013, 70 percent of students who had fallen into default two years after leaving school were non-traditional borrowers (Looney & Yannelis, 2015).

Between 2010 and 2014, the rate of new borrowers fell by 44 percent at for-profit schools and by 19 percent at two-year institutions. Yet the debt burden of former students continues to cast a long shadow. When the cost of a certificate or degree leads to excessive borrowing, there are significant implications for students' career choices (including willingness to take risks as entrepreneurs), personal choices (such as living independently of their families and starting families of their own), and financial choices (such as homeownership). Slow repayment rates suggest that the debt burden drags students down for years (Baum & Johnson, April 2015; Bleemer, Brown, Lee, & van der Klaauw, 2015; Gicheva & Thompson, 2015; Marx & Turner, January 2015; Mezza, Sommer, & Sherlund, October 15, 2014; Looney & Yannelis, 2015).

In New York, 25 percent of residents have some college or an associate's degree but not a bachelor's degree. These residents are more likely to have debt that they cannot repay. Nationally, 58 percent of borrowers whose student loans came due in 2005 hadn't received a degree, according to the Institute for Higher Education Policy. Of those, 59 percent were delinquent on their loans or had already defaulted, compared with 38 percent of college graduates (Cunningham and Kienzl, 2011).

“The median net worth for households with no outstanding student loan debt is nearly three times higher than for households with outstanding student loan debt.”

Another factor limiting the prospects of many recent graduates is the lack of medium- and high-paying job opportunities. Research by the National Bureau of Economic Research and the Federal Reserve has found that many jobs requiring highly skilled workers are offering wages that are too low for college-educated students to live on and still pay back their loans. When unemployment is high, employers have a broader choice of applicants and can seek more qualified candidates at lower wages. In pursuit of cost savings, employers may also leave positions open. The competition for these jobs means that less qualified or less experienced workers are passed over even though they could do the job (Rothstein, 2012; Altig and Robertson, 2012). As a result, it appears in recent national surveys that a number of jobs are unfilled due to lack of qualified candidates (Manpower, 2012), when in fact qualifications are not the main obstacle.

There is wide disparity in employment and earnings among young workers based on their level of education and also among college graduates based on their major. The unemployment rate for young workers without a college degree is significantly higher than for those with a degree. Degree majors that provide technical training (such as engineering, math, or computer science), or majors that are geared toward growing parts of the economy (such as education and health), have done relatively well. At the other end of the spectrum, those with majors that provide less technical and more general training – such as leisure and hospitality, communications, the liberal arts, and even the social sciences and business – have not tended to fare particularly well in recent years; hence the increase in well-educated ALICE households (PayScale, 2014; Abel, Deitz and Su, 2014). For example, the median annual salaries of college-educated workers age 25 to 59 range from \$39,000 for an early childhood educator to \$136,000 for a petroleum engineer (Carnevale, Cheah, and Hanson, 2015).

Low wages, then, are the main problem, in tandem with strong competition for the fewer well-paying jobs. This situation will improve slightly as unemployment falls. But major change will not occur unless there is a structural shift in the kinds of jobs that make up our economy.

Nevertheless, basic secondary education remains essential for any job, and the performance and graduation rates of New York’s public schools – especially for low-income students and students of color – remain an area of particular concern. In fact, according to the Alliance for Excellent Education (AEE), if 90 percent of students had graduated from high school in New York in 2013 their aggregate increased annual income would be \$500 million, and increased federal and state tax revenues would be \$166 million (AEE, 2013).

“Nevertheless, basic secondary education remains essential for any job, and the performance and graduation rates of New York’s public schools – especially for low-income students and students of color – remain an area of particular concern.”

FOOD

Having enough food is a basic challenge for ALICE households. The U.S. Department of Agriculture (USDA) defines food insecurity as the lack of access, at times, to enough food for an active, healthy life for all household members and limited or uncertain availability of nutritionally adequate foods. According to Feeding America’s 2015 Map the Meal Gap study, 14 percent of New York’s residents are food insecure – including 938,610 children. Similarly, according to the USDA, between 2012 and 2014, 14 percent of New York households experienced food hardship, slightly below the national average of 14.3 percent. There are also much higher rates of food insecurity in some counties, including 20 percent in Kings County (Brooklyn) and 19 percent in the Bronx. National comparison shows that the NYC metropolitan area had the most food hardship in the state, ranking 46th out of 107 U.S. metro areas. Rates were slightly better in other parts of the state with Rochester ranking

70th; Buffalo-Cheektowaga-Niagara Falls ranking 83rd; Syracuse ranking 90th; and Albany-Schenectady-Troy ranking 104th (USDA, 2014; Gundersen, Engelhard, Satoh, and Waxman, 2014; Feeding America, 2015; U.S. Department of Agriculture (USDA), 2015; Food Research and Action Center (FRAC), 2015).

Focusing on New York City separately from its surrounding areas, the five boroughs have slightly higher rates of food insecurity than the rest of the state. Compared to the state's 14 percent food insecurity, 16 percent of NYC residents are food insecure, and they make up half of all of the state's 2.6 million food insecure residents (Feeding America, 2015). Each year approximately 1.4 million NYC residents – including 339,000 children – rely on emergency food programs such as soup kitchens and food pantries (Food Bank for New York City).

Food insecurity is often a recurrent situation. USDA national data has found that for both food-insecure and very low food-insecure households (those with multiple instances of disrupted eating patterns and reduced food intake), on average they were food insecure for 7 months of the year (Coleman-Jensen et al., 2015).

Beyond food insecurity, ALICE families have difficulty accessing healthy food options. Many low-income households work long hours at low-paying jobs and do not have time to regularly shop for and prepare low-cost meals. In addition, they are faced with higher prices for and often minimal access to fresh food in low-income and rural neighborhoods, which often makes healthy cooking at home difficult and unaffordable. More convenient options like fast food, however, are usually far less healthy. In New York, 34 percent of adults and 48 percent of adolescents do not eat fruit or vegetables daily. This may be explained in part by the fact that 21 percent of New York neighborhoods do not have healthy food retailers within a half-mile, even if this percentage is lower than the national average of 30.5 percent (Centers for Disease Control and Prevention (CDC), 2014).

“Beyond food insecurity, ALICE families have difficulty accessing healthy food options. Many low-income households work long hours at low-paying jobs and do not have time to regularly shop for and prepare low-cost meals.”

When ALICE families do not have enough food, they use various strategies to avoid hunger. The primary options for children are the federal School Breakfast and Lunch Programs, which provide free (for those with family income below 130 percent of FPL), reduced-price (for those with family income below 185 percent of FPL), or full-price (for those with income above \$43,568 for a family of four annually) breakfast and lunch at participating schools throughout New York. In 2014, approximately half of students in the state were eligible for free breakfast or lunch and 7 percent were eligible for reduced-price lunch. In terms of participation by eligibility, three-quarters of students eligible for a free lunch participated; 57 percent of those eligible for a reduced-price lunch participated; and one-third of those required to pay full price participated. The gaps in participation for those with few other resources suggest that these children face food insecurity at various times throughout the year (New York State Office of Temporary and Disability Assistance, 2016; New York State Education Department, 2014).

Other options – such as purchasing food that is less healthful but cheaper and more calorically dense – are not always successful and can result in unintended health problems. According to the recent Feeding America national survey, buying inexpensive, unhealthy food is the most commonly reported coping strategy for food-insecure families (reported by 78.7 percent of respondents), and many families also buy food that has passed its expiration date (56 percent). Eating foods that are higher in fat, sodium, and sugar, or that are no longer fresh, can contribute to obesity, heart disease, diabetes, low energy levels, and poor nutrition. The second most common strategy is to seek federal or charitable food assistance (63 percent), and a third is to sell or pawn personal property to obtain funds for food (34.9 percent), which is not a sustainable solution. Most respondents to the survey employed two or more of these strategies (Feeding America, 2014).

In line with documented links between food insecurity and obesity, ALICE families are more vulnerable to obesity than families with higher income. ALICE households often lack access to healthy, affordable food or the time to prepare it, and they have fewer opportunities for physical activity because of long hours at work and poor access to recreational spaces and facilities. In addition, stress often contributes to weight gain, and ALICE households face significant stress from food insecurity and other financial pressures. These factors help explain why obesity is increasing for those in poverty as well as for households with higher levels of income (Hartline-Grafton, 2011; FRAC, 2015; Kim and Leigh, 2010). In New York overall, more than 27 percent of adults are overweight or obese, just below than the national average of 28 percent (CDC, 2014).

Broader Consequences for Food in New York

Not having enough income to afford healthy food has consequences not only for ALICE's health, but also for the strength of the local economy and the future health care costs of the wider community. Numerous studies have shown associations between food insecurity and adverse health outcomes such as coronary heart disease, cancer, stroke, diabetes, hypertension, and osteoporosis (Seligman, Laraia and Kushel, 2010; Kendall, Olson and Frongillo, 1996). The USDA argues that healthier diets would prevent excessive medical costs, lost productivity, and premature deaths associated with these conditions (USDA, 1999).

Future Prospects

The USDA's Thrifty Food Plan does not provide for a sustainable, healthy diet, especially with the continued increase in the cost of food staples. A recent Institute of Medicine (IOM) report finds that most benefit levels for SNAP (formerly food stamps) are based on unrealistic assumptions about the cost of food, time preparation, and access to grocery stores (IOM, 2013). Other public health and nutrition advocates have been even more critical (FRAC, December 2012). Unrealistic assumptions about the cost of food and the time it takes to prepare have ripple effects for those relying on SNAP, who often don't get the benefits they need and may be judged as wasteful if they try to use their benefits to buy higher quality or quick-to-prepare foods.

The use of government food programs as well as soup kitchens, food pantries, and food banks has increased steadily through the Great Recession to the present. From 2009 to 2014, SNAP enrollment increased by 39 percent across New York. The 2009 Recovery Act boosted SNAP benefits, but after it expired in 2013, some individuals no longer qualified and many others had their benefits reduced. Though SNAP enrollment has slowed since the Great Recession, it has continued to increase at a slower rate across the state (Dean and Rosenbaum, 2013; Loveless, 2015; Food Research and Action Center, 2014; Food Research and Action Center, 2016). Yet the strong, ongoing increase in the use of soup kitchens, food pantries, and food banks suggests that many New York residents still cannot meet their food needs and often employ more than one strategy to avoid hunger. Feeding America reports that nationally, the number of unique clients served by their programs increased by roughly 25 percent from 2010 to 2014 (Feeding America, 2014).

The long-term consequences of food insecurity can be severe, especially for children. Prolonged food insecurity can lead to a variety of physical, cognitive, and psychosocial stressors. Even when controlling for poverty, children from food insecure households have been shown to score lower on measures of arithmetic skills while also being more likely to have repeated a grade and more likely to have been seen by a psychologist. Food-insecure teenagers are more likely to have been suspended from school and have difficulty forming relationships. For adults, the consequences include greater risk of low-weight births, worse

“The use of government food programs as well as soup kitchens, food pantries, and food banks has increased steadily through the Great Recession to the present.”

academic outcomes, and lower wages (Alaimo, Olson, and Frongillo, 2001; New York City Coalition Against Hunger, 2015). In a vicious cycle, some of the strategies people use to avoid hunger can actually lead to more families becoming ALICE or slipping into poverty, through either poor health and additional health care costs or reduced assets to weather an unexpected emergency.

TRANSPORTATION AND COMMUTING

New Yorkers are known for long commutes. The mean travel time to work in New York – via both public and private transportation – is 32.6 minutes, above the national average of 26 minutes. An overview of commuting patterns is highlighted in Figure 41. Thirty percent of commuters in New York – using both public and private transportation – commute to another county for work (Figure 41). There is huge variation across the state: In 20 counties, fewer than 30 percent of workers commute outside their home county, while in another 24 counties, more than 40 percent of workers do so (U.S. Census, 2014).

The work commute varies greatly across New York, divided primarily between those who drive and those who use public transportation. Each type of transportation poses particular challenges for ALICE. Because many ALICE workers are employed in the service sector and are required to be on the job in person, the timeliness of commuting is critical for them.

In New York, public transportation is concentrated in NYC and the surrounding counties. The highest public transportation usage in the state is in Bronx, Kings (Brooklyn), and New York (Manhattan) counties, where more than 60 percent of workers use public transportation to get to their jobs. There is also significant usage in Queens (52 percent), Richmond (Staten Island) (29 percent), Westchester (22 percent), and Nassau counties (15 percent). All other counties in the state fall below the 8 percent threshold, and in most, fewer than 2 percent of commuters use public transportation (American Community Survey, 2014).

The primary advantage of public transportation is that it costs significantly less than owning and operating a vehicle – particularly in New York City, where the cost of parking adds an additional layer of expense to driving. However, the primary challenge of public transportation is that it often takes longer than driving. The average commute for people living in NYC’s “outer” boroughs – Bronx, Kings (Brooklyn), Queens, and Richmond (Staten Island) counties – is between 42 and 43 minutes, while Albany residents have an average commute of 20 minutes. In addition, public transportation is subject to disruptions, and it is not always located near home or work (American Community Survey, 2014; County Health Rankings and Roadmaps, 2015; Metropolitan Transportation Authority, 2013; American Public Transportation Association, 2007).

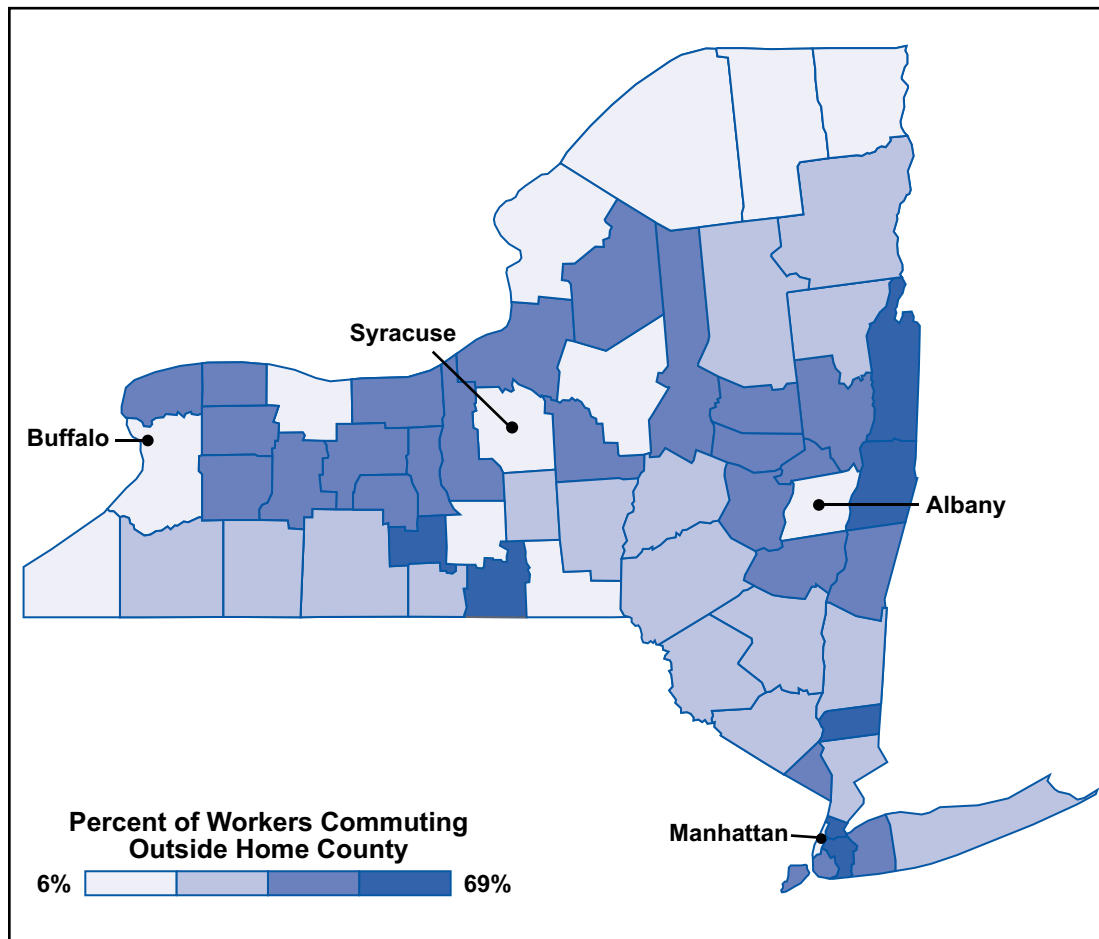

Across much of the surrounding counties region and in the Rest of State, public transportation options are limited, so a vehicle often becomes essential for employment. In 2014, 54 percent of New York workers drove alone to work; some chose this for convenience, while others with variable work hours had no choice.

The average cost of owning and operating a car in the U.S. ranges from about \$6,000 to \$12,000 per year, according to AAA. Long commutes add costs (such as car maintenance, gas, and child care) that ALICE households cannot afford. Commutes also reduce time for

“Because many ALICE workers are employed in the service sector and are required to be on the job in person, the timeliness of commuting is critical for them.”

other activities such as exercise, shopping for and cooking healthy food, and community and family involvement (AAA, 2013; HUD, 2014). Since the vehicles that ALICE families can afford are usually older and of lesser value, the median car value for low-income families is \$4,000, or about one-third of the \$12,000 median value of cars owned by middle-income families. Low-income families are also more likely to face higher and more frequent repair bills and therefore greater disruption in their transportation to work (Bricker, Kennickell, Moore, and Sabelhaus, 2012).

Figure 41.
Percent of Workers Commuting Outside Home County, New York, 2014

Source: U.S. Census, 2014

Cars also impact the broader quality of life. Nationally, families with a car are more likely to have a job and live in neighborhoods with greater safety, environmental quality, and social quality than households without cars. Both cars and transit access also have a positive effect on earnings, though the effect of car ownership is considerably larger (Pendall et al., 2014).

One way low-income households try to close the income gap is by skimping on expenses, and those expenses often include car insurance. Despite the fact that driving without insurance is a violation in almost all states, including New York, 5.3 percent of New York motorists were uninsured in 2012 (Insurance Information Institute, 2012). Another cost-saving strategy is not registering a vehicle, avoiding the annual fee and possibly the repairs needed for it to pass inspection.

“Nationally, families with a car are more likely to have a job and live in neighborhoods with greater safety, environmental quality, and social quality than households without cars.”

“The rising trend of nonstandard and part-time schedules can complicate transportation for low-wage workers, who may be relying on friends or family for rides or using public transportation.”

These strategies may provide short-term savings, but they have long-term consequences such as fines, towing and storage fees, points on a driver’s license that increase the cost of car insurance, and even impounding of the vehicle. Because of long collection times and cumulative fines and interest, the amounts can be more than ALICE families can pay (New York State Bar Association, 2016).

ALICE drivers face similar challenges paying traffic tickets. The system of sizable fixed fines for particular offenses in most municipalities hits low-income drivers harder than those who are more affluent. Preliminary reports across the country have found that in many states, when drivers can’t pay a ticket, their driver’s license can be suspended, harming credit ratings, raising public safety concerns, and making it harder for people to get and keep jobs and take care of their families (Urbana IDOT Traffic Stop Data Task Force, 2015; Lawyers Committee for Civil Rights, 2015).

Broader Consequences for Transportation in New York

“Cost-cutting” strategies have risks for ALICE households as well as for the wider community. Long commutes reduce worker productivity and state economic competitiveness. In fact, one study finds that, on average, absenteeism would be about 15 to 20 percent lower if all workers had a negligible commute. Long commutes can also impact new hire retention and performance (van Ommeren and Gutierrez-i-Puigarnau, 2010; Belsky, Goodman, and Drew, 2005; Sullivan, 2015; National Economic Council, 2014).

Older cars that may need repairs make driving less safe and increase pollution for all, as does deferring car maintenance. Vehicles without insurance increase costs for all motorists; uninsured and under-insured motorist coverage adds roughly 8 percent to an average auto premium for the rest of the community (McQueen, 2008). And when there is an emergency, such as a child being sick or injured, if an ALICE household does not have reliable transportation, their options are poor – forgo treatment and risk the child’s health, rely on friends or neighbors for transportation, or resort to public specialty transit services or even an ambulance, increasing costs for all taxpayers.

Moving further away from job centers not only increases commuting, but has a wider impact on the community as well. Urban sprawl adds costs for additional infrastructure and services such as roads, public transit, and sewage.

Future Prospects

For ALICE households in New York, housing and transportation are tightly linked and can have a large impact on the household budget. People who live in location-efficient neighborhoods – compact, mixed-use, and with convenient access to jobs, services, transit, and amenities – have lower transportation costs than those who don’t. According to the Center for Neighborhood Technology’s (CNT) Housing and Transportation Affordability Index, many New York workers live in location-inefficient areas, and as a result have high transportation costs (CNT, 2013). Commuting long distances will only increase in the coming years as lack of affordable housing persists and pushes people away from employment centers.

Jobs and transportation are also linked. The rising trend of nonstandard and part-time schedules can complicate transportation for low-wage workers, who may be relying on friends or family for rides or using public transportation. Irregular work schedules can make it difficult to get to work on time, or transportation can become cost prohibitive on less than a full-time work schedule (Watson, Frohlich, and Johnston, 2014).

Given the size and age of New York’s transportation infrastructure and the state’s growing population, it will be expensive for the state to meet the increasing demand for transportation improvements. With tight state budgets, it has proven difficult to maintain public transportation service and fares. Yet without transportation investment, costs will increase for ALICE auto commuters in terms of both time spent in transit and wear and tear on their vehicles, and for public commuters in terms of both access and cost (American Society of Civil Engineers, 2013; National Economic Council and the President’s Council of Economic Advisers, 2014; American Society of Civil Engineers’ New York State Council, 2015).

HEALTH CARE

Quality of health directly correlates to income: Low-income households in the U.S. are more likely than higher-income households to be obese and to have poorer health in general. In New York, people with household income below \$25,000 were more than 50 percent more likely to report being obese than those with household income above \$75,000 (CDC, 2011; CDC, Behavioral Risk Factor Surveillance System, 2014; New York State Department of Health, 2014).

This is a two-way connection: Having a health problem can reduce income and increase expenses, often causing a family to fall below the ALICE Threshold or even into poverty. And trying to maintain a household with a low income and few assets can also cause poor health and certainly mental stress (Choi, 2009; Currie and Tekin, 2011; Federal Reserve, 2013; Zurlo, Yoon, and Kim, 2014). State and national research on “toxic stress” has found that living in chronically stressful situations, such as living in a dangerous neighborhood or in a family that struggles to afford daily food, damages neurological functioning, which in turn impedes a person’s – especially a child’s – ability to function well (Shonkoff and Garner, 2012; Evans, Brooks-Gunn, and Klebanov, 2011).

Recent studies have found that access to medical care alone cannot help people achieve and maintain good health if they have unmet basic needs, such as not having enough to eat, living in a dilapidated apartment without heat, or being unemployed (Berkowitz et al., 2015; Robert Wood Johnson Foundation, December 2011). In a 2011 survey by the Robert Wood Johnson Foundation, physicians reported that their patients frequently express health concerns caused by unmet social needs, including the conditions in which people are born, grow, live, work, and age. Four in five physicians surveyed say unmet social needs are directly leading to poor health. The top social needs include: fitness programs (75 percent), nutritious food (64 percent), transportation assistance (47 percent), employment assistance (52 percent), adult education (49 percent), and housing assistance (43 percent) (Robert Wood Johnson Foundation, December 2011).

ALICE households often try to save on health care by forgoing preventative care and health insurance. As a result, they more frequently use the emergency room (ER) for advanced treatment that might not have been necessary if they had had earlier access to in-office primary or specialty care. In addition, without regular preventative care and coverage, they are more likely to develop chronic health conditions (Majerol, Newkirk, and Garfield, January 2015). These ongoing conditions lead to additional medical and care expenses and often require family members to devote time to caregiving, which is discussed further in the Conclusion.

Preventative Health Care

A common way to try to save on health care costs is to forgo preventative health care. With basic preventative care now covered through the ACA (even in high-deductible plans), cost is less of a barrier to seeing a primary care doctor. However, there are still cost barriers to filling prescriptions for maintenance medications, getting to doctors’ offices, and maintaining a healthy lifestyle (Commonwealth Fund, 2013; Cohen, Kirzinger, and Gindi, 2013).

“Having a health problem can reduce income and increase expenses, often causing a family to fall below the ALICE Threshold or even into poverty. And trying to maintain a household with a low income and few assets can also cause poor health and certainly mental stress.”

“Across the U.S., funding has been cut for mental health services while demand has increased. The result has been longer waiting lists for care, less money to help patients find housing and jobs, and more people visiting ERs for psychiatric care.”

Forgoing preventative dental care is even more common, especially as Medicaid coverage for dental care is minimal and there are relatively few dentists who participate in Medicaid. As a result, low-income adults and children are almost twice as likely as those with higher-income to have gone without a dental check-up in the previous year. In New York, 33 percent of adults did not visit the dentist in 2013 – 2014, and only 40 percent of Medicaid-enrolled children and adolescents in New York received preventative dental treatment in 2013, well below the national average of 48 percent (Centers for Medicare and Medicaid Services, 2015; U.S. Government Accountability Office (GAO), 2013; New York State Department of Health, 2015; Bureau of Dental Health, 2006; Kaiser Family Foundation, 2014).

Poor oral health causes pain, can result in poor nutrition, and increases the risk for diabetes, heart disease, and poor birth outcomes. Oral health problems have even more implications for children, including eating difficulties, altered speech, pain, and infection (McCarthy, Radley, and Hayes, 2015; U.S. Senate Committee on Health, Education, Labor & Pensions, 2012).

The Health Policy Institute reports that the number of ER visits for dental conditions in the U.S. doubled from 2000 to 2012 and continues to rise as the number of dental office visits declines. In 2012, ER dental visits cost the U.S. health care system \$1.6 billion, with an average cost of \$749 per visit. Up to 79 percent of ER dental visits could be diverted to more cost-efficient community settings. For example, an analysis in Maryland estimates that the state Medicaid program could save up to \$4 million each year through these types of diversion programs (Wall and Vujicic, 2015).

Forgoing health care also has consequences for mental health. Thirty-five percent of New York adults reported poor mental health in 2014. Between 2009 and 2013, about 3.7 percent of adult New Yorkers reported having been diagnosed with a serious mental illness in the past year, slightly lower than the national rate of 4.1 percent (SAMHSA, 2014). Yet New York’s public health system has struggled to provide services, which fits with national trends. National data from 2013 show that fewer than 40 percent of adults living with mental illness received treatment – and that represented an increase from 2007, when only 17 percent of adults received treatment. Across the U.S., funding has been cut for mental health services while demand has increased. The result has been longer waiting lists for care, less money to help patients find housing and jobs, and more people visiting ERs for psychiatric care (Kaiser Family Foundation, 2014; Aron, Honberg, Duckworth, et al., 2009; Glover, Miller and Sadowski, 2012; NAMI, 2010).

Cost is one of the primary reasons that people do not seek mental health treatment. In recent national surveys, over 65 percent of respondents cited money-related issues as the primary reason for not pursuing treatment. Even among people with private insurance, over half said that the number one reason they do not seek mental health treatment is because they are worried about the cost. For those without comprehensive mental health coverage, treatment is often prohibitively expensive (Center for Behavioral Health Statistics and Quality, 2012; Parity Project, 2003).

Mental illness is also an issue for children and adolescents in New York State, given that half of mental health disorders appear before age 14 (Mental Health Association in New York State, 2016). In New York, 9 percent of minors aged 12-17 experienced a major depressive episode in 2012–2013, slightly lower than the national rate of 10 percent (SAMHSA, 2014). According to the National Center for Children in Poverty, the consequences of untreated mental illness in children and teens are severe. Nationally, 44 percent of youth with mental health problems drop out of school; 50 percent of children in the child welfare system have mental health problems; and 67 to 70 percent of youth in the juvenile justice system have a diagnosable mental health disorder (Stagman and Cooper, 2010; NAMI, 2010). National research also shows that, consistent with other areas of health, children in low-income

households (such as ALICE) and children of color who have special health care needs have higher rates of mental health problems than their White or higher-income counterparts, yet are less likely to receive mental health services (VanLandeghem and Brach, 2009).

In addition to the high costs of health care, low-income families and families of color across the country may experience other barriers to care, including language and cultural barriers, transportation challenges, and difficulty making work and child care arrangements to accommodate health care appointments (U.S. Senate Committee on Health, Education, Labor & Pensions, 2012). When care is hard to access, a health problem worsens, and the cost of treatment increases significantly for the patient or, if the patient cannot pay, for the state.

Insurance Coverage

Another way to save on health care costs is to go without health insurance. The rate of health insurance coverage for low-wage workers has fallen steadily over the last three decades across the country. In New York, 9 percent of all residents under 65 years old did not have health insurance in 2014, while 12 percent of those with income below 200 percent of the Federal Poverty Level (roughly below the ALICE Threshold) were without insurance (Kaiser Family Foundation, 2014; Federal Reserve, 2014; Schmitt, 2012).

Initial reports on the impact of the Affordable Care Act (ACA) and the Health Insurance Marketplace in New York suggest that the ACA has resulted in an additional modest reduction in the number of uninsured New Yorkers. About half of the uninsured in New York are not eligible for assistance and 34 percent are eligible only for tax credits. These families will have to go without or buy less insurance coverage than they need; it is not surprising that the Commonwealth Fund finds that 30 percent of New York residents are underinsured (Kaiser Family Foundation, June 2014; McCarthy, Radley, and Hayes, 2015; Cohen and Martinez, 2015; Witters, 2015).

In addition, specialty care, such as mental health care and dental care, remains particularly difficult to obtain in part due to the lack of providers accepting Medicaid (Kaiser Family Foundation, 2015; Kaiser Commission on Medicaid and the Uninsured, June 2012; U.S. GAO, 2012; U.S. GAO, 2015).

Emergency Room Use

Forgoing preventative care and health insurance often results in poorer health status and increases in ER use, hospitalizations, and cardiovascular events (Heisler, Langa, Eby, Fendrick, Kabeto, and Piette, 2004; Piette, Rosland, Silveira, Hayward, and McHorney, 2011). When health care is expensive, many ALICE families only seek care when an illness is advanced and pain is unbearable. It is at that point that many people go to the ER for help because their condition has reached a crisis point and they have no other option. Notably, low income is the most important cause of avoidable hospital use and costs, according to a recent Rutgers study (DeLia and Lloyd, 2014).

In 2013, the number of ER visits in New York was 435 per 1,000 people, compared to the national rate of 428 per 1,000. Nationally, New York had the seventh-best score in the country in terms of rates of potentially avoidable ER visits (McCarthy, Radley, and Hayes, 2015; Kaiser Family Foundation, 2015).

Caregiving

Another dimension of health care that can add significant cost is caregiving for a sick or elderly family member or someone living with a disability. A 2015 AARP survey in New York found that half of adults 50 and older in New York have provided unpaid care to an adult loved

“When health care is expensive, many ALICE families only seek care when an illness is advanced and pain is unbearable. It is at that point that many people go to the ER for help because their condition has reached a crisis point and they have no other option.”

“While families of all income levels may choose to care for family members themselves, many caregivers are forced into the role because they cannot afford to hire outside care.”

one who is ill, frail, elderly, or has a physical or mental disability – caregiving hours worth an estimated \$32 billion. Seventy-four percent of those people said that caregiving impacted their work schedule to the point where they had to leave work early, arrive late, or take days off to provide necessary caregiving (AARP, 2014).

National estimates of the number of caregivers vary, ranging from 18 percent (in a 2015 AARP survey) to 23 percent of workers and 16 percent of retirees (in the Employee Benefit Research Institute’s 2015 Retirement Confidence Survey) to 9 percent of the adult population (in a 2014 RAND Corporation survey) (AARP Public Policy Institute, 2015; Helman, Copeland, and VanDerhei, 2015; Ramchand et al., 2014).

While families of all income levels may choose to care for family members themselves, many caregivers are forced into the role because they cannot afford to hire outside care. In fact, half of caregivers report that they had no choice in taking on their caregiving responsibilities, and almost half (47 percent) reported household income of less than \$50,000 per year (AARP Public Policy Institute, 2015). The value of caregiving is significant for care recipients; the presence of an informal caregiver can improve care recipients’ well-being and recovery and defray medical care and institutionalization costs. Yet caregiving is costly for families in several ways, including added direct costs, mental and physical strain on the caregiver, and lost income due to decreased hours or loss of job (Ramchand et al., 2014; Tanielian et al., 2013).

Family caregiving exacts a toll both on the caregivers and on the broader economy. Nationally, 18 percent of caregivers report experiencing extreme financial strain as a result of providing care (4 or 5 on a 5-point scale), and another 20 percent report moderate financial strain. Another 19 percent of caregivers report a high level of physical strain resulting from caregiving, and 38 percent consider their caregiving situation to be emotionally stressful (AARP Public Policy Institute, 2015).

For the 60 percent of caregivers who are working, caregiving is also costly in the time it takes away from employment. Six in 10 caregivers report having experienced at least one impact or change to their employment situation as a result of caregiving, such as cutting back on their working hours, taking a leave of absence, or receiving a warning about performance or attendance (AARP Public Policy Institute, 2015). A 2010 MetLife Mature Market Institute study quantifies the opportunity cost for adult children caring for their elderly parents. For women, who are more likely to provide basic care, the total per-person amount of lost wages due to leaving the labor force early and/or reducing hours of work because of caregiving responsibilities was on average \$142,693 over the care period. The estimated impact of caregiving in lost Social Security benefits was \$131,351, and a very conservative estimate for reduced pensions was approximately \$50,000. In total, nationally, the cost impact of caregiving on an individual female caregiver in terms of lost wages and retirement benefits was \$324,044 (MetLife, 2010).

Broader Consequences for Health and Health Care in New York

Some families in New York are ALICE because they have extensive health care needs; others face deteriorating health because they lack the time and money for adequate care. In both cases, there are increased cost to society due to increased public health care use, lost productivity, and higher rates of poverty and criminality.

Untreated mental health and substance abuse issues shift problems to other areas: They increase ER and acute care costs, add to caseloads in the criminal, juvenile justice, and corrections systems, and increase costs to assist the homeless and the unemployed. It should be noted that nationally, each \$1 spent on substance abuse treatment saves \$7 in future health care spending (Glover, Miller, and Sadowski, 2012).

Untreated or improperly treated mental illness also costs employees lost wages for absenteeism, and their companies feel the cost in decreased productivity. A NAMI study estimated that the annual cost to employers for mental-health absenteeism ranged from \$10,000 for small organizations to over \$3 million for large organizations (Harvard Mental Health Letter, 2010; Parity Project, 2003).

The implications of the **lack of dental health care** are often overlooked, but a growing body of scientific evidence has linked poor oral health to missed workdays and increasing public and private expenditures for dental care. There are even wider consequences for children because poor oral health impacts their ability to learn, their school attendance, and their longer-term health outcomes (Bureau of Dental Health, 2006) (Pew Charitable Trusts, 2013).

The wider community feels the consequences of **increased ER use** in increases in health insurance premiums and more need for charity care, Medicare, and hospital community assistance (Bureau of Labor Statistics, 2010; Kaiser Family Foundation, 2011).

In terms of impact on the economy as a whole, **family caregiving** offers substantial health care cost savings, since it is much less expensive than hospital care or a nursing home, but it incurs significant costs for U.S. employers. Family caregiving for the elderly costs employers approximately \$13.4 billion in excess health care spending each year for employees who are also caregivers, due to the toll that caregiving takes on their own health (MetLife, 2010). In addition, an analysis of the Gallup Well-Being survey found that the lost productivity due to absenteeism among full- and part-time caregivers cost the U.S. economy more than \$28 billion in 2010 (Witters, 2011).

Future Prospects

The trend for low-income households to have poorer overall health than higher-income households will increase as health care and healthy food costs rise and the New York population ages. Poor health is a common reason why many households face a reduction in income and become ALICE households in the first place, and without sufficient income, it is even harder to stay healthy or improve health. Low-income households are more likely to be obese and have poor health status, both long-term drivers that will increase health care needs and costs in the future.

The situation may be reversed, or at least slowed, by the ACA, though its impact is not yet clear. New research from the Harvard School of Public Health shows that health insurance coverage not only makes a difference in health outcomes but also decreases financial strain (Baicker and Finkelstein, 2011). Expanded health insurance coverage and more efficient health care delivery would improve conditions for all households below the ALICE Threshold.

Affording Health Care

The group of New Yorkers who may not benefit from the ACA are those who earn above the Medicaid eligibility level and do not qualify for other assistance or subsidies, but do not have enough income to cover all their basic necessities.

Medicaid eligibility in New York for nonelderly adults is for those with income up to 138 percent of the FPL; eligibility for premium tax credits to help New Yorkers purchase coverage in the Marketplace is up to 400 percent of the FPL. For a family with children, Medicaid eligibility increases to 405 percent of the FPL, but those families are not eligible for premium tax credits to help them purchase coverage in the Marketplace. With the Medicaid expansion, over 4 in 10 uninsured New Yorkers (43 percent) became eligible for either Medicaid or CHIP in 2014 (Kaiser Family Foundation, 2014).

“Expanded health insurance coverage and more efficient health care delivery would improve conditions for all households below the ALICE Threshold.”

“Just to maintain current rates of utilization, New York will need an additional 1,220 primary care physicians (PCPs) by 2030, an 8 percent increase compared to the state’s 14,858-PCP workforce as of 2010.”

For workers earning above 138 percent of the Federal Poverty Level but not earning enough to meet all of their basic needs, the ACA plans may not be economical, especially when their incomes are too high to be eligible for premium tax subsidies and they are responsible for meeting their plans’ high deductibles out of pocket. The ADP Research Institute estimates the income threshold for choosing to participate in health care coverage is \$45,000, even when incorporating government subsidies. Initial research on the first wave of ACA enrollment shows that there is a lower rate of participation by low- and moderate- income families (those with income between 138 percent and 400 percent of the FPL), and a higher rate of taxpayers opting to pay the penalty for remaining uninsured instead (\$95 per adult and \$47.50 per child) – 5 percent of taxpayers instead of the 2 to 4 percent originally estimated. In New York, this translates to approximately 21 percent of those uninsured in 2014, according to the Kaiser Family Foundation (ADP Research Institute, 2014; Viebeck, 2015; Koskinen, 2015; Kaiser Family Foundation, 2014).

A New York example is illuminating. According to the Kaiser Family Foundation Subsidy Calculator, a married couple with two children living in Syracuse with an annual income of \$63,252 (the cost of the Household Survival Budget for Onondaga County) would pay a monthly premium of \$448 for the Silver Plan (after taking into account \$12,356 in annual subsidies), which looks much better than the \$564 budgeted in the Household Survival Budget for the family’s health care costs without health insurance. However, the out-of-pocket expenses for the Silver Plan, including co-pays and deductible, could total \$14,300 per year, increasing the monthly cost of the Silver Plan to \$1,756, far more than their current spending. With the subsidies, the cost of the ACA Bronze Plan would actually be \$184, but the co-pays and deductible would still apply and fewer items are covered, so out-of-pocket costs would be higher (Kaiser Family Foundation Health Insurance Marketplace Calculator, 2016). These families will need to make difficult decisions about their health care.

The Physician Shortage

Finding doctors to treat low-income families may be even more difficult in the coming years. According to the Kaiser Family Foundation, there are 28 Primary Care Health Professional Shortage Areas (HPSA) in New York, with 48 percent of need being met. This is significantly worse than the national rate of 60 percent for HPSAs across the country. In addition, there are approximately 23 Dental Care HPSAs in New York, with 62 percent of need being met, and 154 Mental Health HPSAs, with only 44 percent of need being met (Kaiser Family Foundation, 2014).

The availability of primary care is especially important for prevention and cost-effective treatment. People without a usual source of care – particularly the uninsured and Medicaid enrollees – are more likely to rely on ERs for care (Liaw, Petterson, Rabin, and Bazemore, 2014). The lack of primary care not only reduces the quality of health in the short term, but it contributes to more complicated health issues and increased costs over the long term.

Just to maintain current rates of utilization, New York will need an additional 1,220 primary care physicians (PCPs) by 2030, an 8 percent increase compared to the state’s 14,858-PCP workforce as of 2010. Going forward, there will be even greater demand for health care in New York from a population that is aging and is increasingly insured due to the ACA (Petterson, Cai, Moore, and Bazemore, 2013).

Access to Care

In addition, insurance coverage does not guarantee access to health care in New York. In fact, roughly half of the state's PCPs did not accept new Medicaid patients in 2011–12. More doctors are likely to stop accepting Medicaid patients because reimbursement rates are expected to decline, now that federal funding to keep Medicaid reimbursement rates at the same level as when the ACA was introduced has ended (Ollive, 2015; Decker, 2013).

The lack of access to mental health services will also impact ALICE families into the future. Poor mental health outcomes are associated with an array of poor physical health outcomes, including increased occurrence of diabetes, asthma, and cardiovascular disease. In addition, growing up in a household with someone with depression or other mental health problems is considered an adverse childhood experience (ACE). For this reason, unaddressed mental illness can perpetuate a cyclical pattern of dysfunction in families, often for generations (Office of the Mayor, 2015; New York State Department of Health, 2016).

Accessing and affording health care in New York is most difficult for undocumented immigrants, who are not covered by the ACA. This group is likely to remain uninsured and will continue to struggle to find and afford health care (Lloyd, Cantor, Gaboda, and Guarnaccia, 2011; DeNavas-Walt, Proctor, and Smith, 2013).

TAXES

While headlines often feature low-income households receiving government assistance, the analysis of the Household Survival Budget makes clear that ALICE households contribute to the economy by working, buying goods and services, and paying taxes. There is some tax relief for the elderly and the lowest-income earners, but most ALICE households pay about 15 percent of their income in federal taxes. Only very low-income households, earning less than \$20,000 per year for a couple or \$10,000 per year for a single individual (below the FPL), are not required to file a tax return (IRS, 2013). However, when households do not pay their taxes, they increase the cost to other taxpayers, and they incur the risk of being audited and paying fines and interest in addition to the original amount due.

ALICE households pay income, property, and wage taxes. While federal tax credits have made a difference for many ALICE households, they do not match the size of those received by higher-income households, such as the mortgage tax deduction. Taxes paid after federal deductions result in the lowest income quintile paying more than 10 percent in income tax while the highest income quintile pays less than 8 percent, according to the Institute on Taxation and Economic Policy. In terms of payroll taxes, on average, the lowest income group pays more than 8 percent of their income while those in the highest income quintile pay less than 6 percent of theirs. The lowest income group on average also pays almost 8 percent of their income in state sales and excise taxes, while those in the highest income quintile pay less than 3 percent (Marr and Huang, 2012; Institute on Taxation and Economic Policy, 2015).

The Earned Income Tax Credit (EITC) and the Child Tax Credit (CTC) are important ways to reduce poverty, primarily for families with children. According to recent reports, the credits encourage work, with little or no effect on the number of hours worked, and they supplement the wages of low-paid workers. For taxpayers eligible for the EITC who have no qualifying

“While headlines often feature low-income households receiving government assistance, the analysis of the Household Survival Budget makes clear that ALICE households contribute to the economy by working, buying goods and services, and paying taxes.”

“Concerns about money have been the number-one source of stress for Americans for the last 6 years, according to an annual survey by the American Psychological Association.”

children, the credit does little to offset income and payroll taxes. However, among taxpayers (married or single) with qualifying children, there is often a reduction in poverty rates due to the EITC and CTC. For taxpayers with the lowest income, the two credits together more than offset income and payroll taxes to raise living standards (Marr, Huang, Sherman, and Debot, 2015; Hungerford and Thiess, 2013). Overall, the median adjusted gross income of EITC filers in New York is very low – \$14,118 for a household – so the tax credits for which they are eligible are helpful, but are not enough to move them to financial stability (Brookings, 2014).

Broader Consequences for Taxes in New York

When ALICE workers cannot pay their taxes, not only do they face penalties, fees, and the challenges of collection agencies and more paperwork, but the wider community must cover that gap. According to the U.S. GAO, at the end of fiscal year 2011, individuals owed a total of \$258 billion in federal unpaid tax debts (U.S. GAO, 2012). When this happens, the rest of the community must pay more to cover the shortfall and the cost of collection efforts.

Future Prospects

Besides the cost of household basics and the level of current wages, the tax code is another factor in questions of economic inequality. According to the Federal Reserve, federal taxes compress income distribution and reduce income inequality while state taxes widen the after-tax income distribution. As discussed in Section II, according to the Institute on Taxation and Economic Policy’s Tax Inequality Index, New York has the 41st most unfair state and local tax system in the country (Institute on Taxation and Economic Policy, 2015). Still, reductions in tax rates – for income tax, sales tax, and payroll taxes – could increase the income families have to afford the basic Household Survival Budget. In addition, changes in the tax structure could reduce inequality between income groups.

INCOME AND SAVINGS

As discussed throughout this Report, there are many consequences when ALICE families do not have enough income to afford basic household necessities. A common but often overlooked consequence – both for these households and for their wider communities – can be extreme levels of stress.

Concerns about money have been the number-one source of stress for Americans for the last 6 years, according to an annual survey by the American Psychological Association (APA). While stress in general is felt by Americans across the income spectrum, stress about money follows a different pattern; adults in lower-income households are twice as likely as those in higher-income households to say they feel stress about money all or most of the time (36 percent vs. 18 percent). The difference in overall stress levels based on income also increased during and after the Great Recession: In 2007, average reported stress levels were the same regardless of income, but by 2014, those living in lower-income households reported higher overall stress levels than those living in higher-income households (5.2 vs. 4.7 on a 10-point scale) (American Psychological Association, 2015).

There are several sources of stress for low-income households. The most common sources in the APA survey were paying for unexpected expenses (54 percent said very or somewhat significant), paying for essentials (44 percent), and saving for retirement (44 percent) (American Psychological Association, 2015). Others are more subtle – such as forms of bias that flow from the everyday social experience of being poor in America – but they nevertheless function as a constant and potent source of stress. Whether discrimination is driven by income, gender, skin

color, or other factors, the health impacts and cognitive consequences of persistent bias can be devastating (Daminger, Hayes, Barrows, and Wright, 2015).

An extensive body of research confirms that the multiple stresses that accompany poverty can overload the brain systems involved in decision-making, with severe consequences (Center on the Developing Child, 2016; Mani, Mullainathan, Shafir, and Zhao, 2013; Mullainathan and Shafir, 2009; McEwen and Gianaros, 2011; Daminger, Hayes, Barrows, and Wright, 2015). Working in low-wage, high stress jobs (such as demanding service positions), especially those with low levels of autonomy and high emotional demands, can lead to decreased functioning on and off the job, reducing parents' ability to provide for their children or plan for their own future. These workers are more likely to have poorer performance, higher turnover, and a greater likelihood of negative or aggressive responses while on the job.

Some people experiencing stress attempt to self-medicate with drugs or alcohol. Addiction can be the cause of a family becoming ALICE, but it can also be a consequence (Center on the Developing Child, 2016). In addition, the stresses that accompany poverty are most often overlapping and compounding, so ALICE individuals and families are likely to experience more intractable stress levels than individuals and families with higher incomes.

Broader Consequences for Income and Savings in New York

When ALICE workers and their families struggle to afford a basic household budget, there are consequences for the whole community, as outlined above. From another perspective, ALICE individuals who are struggling to make ends meet are often less productive workers. They are more likely to be tired or stressed on the job, late to work, or absent. With fewer dollars in savings to weather an emergency, they are disproportionately impacted by crises and less able to return to work quickly. Together, these factors put a strain on fellow workers and drain company resources. In addition, unemployed workers add costs to government programs, from unemployment benefits to all the social services necessary to support a family, as outlined in the ALICE Income Assessment in Section IV. These expenses increase taxes for all.

Without asset-building stakeholders, communities may experience instability and a decline in economic growth. When ALICE families do not have savings, they do not have the resources to resolve an emergency and are often forced to seek public assistance, which puts them in a more vulnerable position than if they had had the means to address the issue immediately. The community as a whole not only shares the cost of emergency services, but also feels the broader social and economic disruption that such emergencies cause.

Future Prospects

While prospects for jobs and income in New York (discussed further in the Conclusion) are crucial to knowing what the future will hold for ALICE families, the long-term effects of a lack of savings may have just as great an effect on the state in the coming years.

Prospects for public assistance for ALICE families are moderate. With many government benefits now linked to work and many jobs increasingly subject to changes in hours due to seasonal or economic activity, ALICE workers are often in a precarious position. An unexpected reduction in hours means a loss of pay, and it can mean the loss of employer or government benefits that are tied to work hours, including paid and unpaid time off, health insurance, unemployment insurance, public assistance, and work supports. In fact, low-wage workers are 2.5 times more likely to be out of work than other workers, but only half as likely to receive unemployment insurance (Garfield, Damico, Stephens, and Rouhani, 2015; Watson, Frohlich, and Johnston, 2014; U.S. GAO, 2007).

“With many government benefits now linked to work and many jobs increasingly subject to changes in hours due to seasonal or economic activity, ALICE workers are often in a precarious position.”

“Because low-income households have few assets to begin with – and the assets they have are more likely to be either liquid assets, which are consumed by emergencies, or cars, which do not gain in value over time – it is extremely difficult for ALICE families to improve their asset base.”

Overall, both in New York and nationally, benefits programs have retrenched since phasing out of the American Recovery and Reinvestment Act of 2009; extended federal unemployment benefits were shut off in April 2012, and emergency unemployment compensation shut off at the end of 2013. The notable exception is the expansion of health insurance coverage with the rollout of the ACA. In some cases, nonprofits have worked to fill these benefit gaps, most notably with food pantries expanding as SNAP benefits fall.

The lack of savings may not be noticed from day to day, but it takes its toll over time – when there are no resources for an emergency and a family can spiral into homelessness, when a family cannot send their child to college, or when seniors cannot retire. Those who lost their jobs or moved into lower-paying jobs during the Great Recession have used their savings to get by, and with lower wages, many have not been able to replenish those savings. This lack of resources to invest is one of the strongest drivers of financial inequality in the U.S. Because low-income households have few assets to begin with – and the assets they have are more likely to be either liquid assets, which are consumed by emergencies, or cars, which do not gain in value over time – it is extremely difficult for ALICE families to improve their asset base.

Lack of savings has consequences both for short-term financial stability and for longer-term economic mobility. According to The Pew Charitable Trusts Economic Mobility Project, even for low-income families, the children of parents who save are more likely to experience upward mobility than the children of those who do not (Cramer, O’Brien, Cooper, and Luengo-Prado, 2009).

CONCLUSION

This Report on **Asset Limited, Income Constrained, Employed (ALICE)** households across New York offers a new set of tools that policymakers and other stakeholders can use to understand financial hardship in the state on both the state and local levels. The Report explains how much it costs to live at the most basic level in the local economy in each New York county, using the **Household Survival Budget**. In addition, the Report reveals that a full 44 percent of households in New York cannot reach even that most basic level, because they earn below the **ALICE Threshold** for economic survival.

In order to address the state's economic challenges, it is important to recognize that ALICE families are forced to take risks in order to get by, such as forgoing health insurance, car repairs, or a meal – risks that can be harmful to the families involved and costly for the wider community.

ALICE households range from young families with children to senior citizens. They face a variety of challenges: low-wage jobs located far from their homes (with the attendant rise in commuting costs); financial barriers that limit access to low-cost community banking services; and having few or no assets to cushion the cost of an unexpected health emergency or caregiving need. Some households become ALICE after an emergency, while others have been struggling near the poverty line since the Great Recession. Effective policy solutions will need to reflect this reality.

While ALICE families differ in their composition, obstacles, and magnitude of need, there are three broad trends that will influence who becomes ALICE in New York and what the implications will be for the wider community:

1. Population changes – aging, migration, and racial and ethnic diversity
2. Jobs – unemployment and underemployment, employment practices, trends, and changes in the number and types of jobs that are available
3. Voting – national, state, and local elections and ALICE's political voice

What will it take to make a difference for ALICE families and expand the options they have? With the **Economic Viability Dashboard**, New York stakeholders can better identify where housing is affordable relative to local wages, where there are job opportunities, where there are strong community resources for ALICE households – and where there are gaps.

As the **ALICE Income Assessment** documents, despite aggregate ALICE household earnings of \$85.6 billion and another \$83.2 billion in spending by government, nonprofits, and health care organizations, there are still 3.2 million households in New York that struggle financially.

Without public assistance, ALICE households would face even greater hardship, and many more would slide into poverty. Yet because these households struggle just to satisfy their basic needs, it is almost impossible for them to gain enough traction to improve their overall circumstances, and government assistance is not designed to address this predicament. The majority of programs aim to alleviate poverty and help the poor obtain basic housing, food, clothing, health care, and education – not to enable long-term economic stability (Haskins, 2011; Shaefer & Edin, 2013).

Economic insecurity is pervasive among ALICE households. This is clearest in Social Security spending: Most senior households have incomes that are above the Federal Poverty Level (FPL) but often still below the ALICE Threshold for economic survival. Quantifying the problem can help stakeholders best decide whether to fill that gap by working to increase income for ALICE households or decrease expenses for basic household necessities.

“In order to address the state’s economic challenges, it is important to recognize that ALICE families are forced to take risks in order to get by, such as forgoing health insurance, car repairs, or a meal – risks that can be harmful to the families involved and costly for the wider community.”

“New York’s population has become both older and more diverse, and this trend is projected to continue into the next two decades for all areas of the state.”

This section also reviews the short-term interventions that can help sustain New York’s ALICE households through an emergency, as well as medium-term strategies that can ease the consequences and hardship of those struggling to achieve economic stability. Finally, this section considers the long-term, large-scale economic and social changes that would significantly reduce the number of households with income below the ALICE Threshold.

POPULATION CHANGES

New York, along with its New England neighbors, is one of the slower-growing states in the U.S.; the population is expected to grow overall by 3 percent from 2000 to 2030, while the U.S. overall is expected to grow by 29 percent (Figure 42). There is significant movement in and out of the state, varying by age group. The younger population is expected to decrease overall, those aged 17 and under by 8 percent and the population aged 18 to 64 by 5 percent. At the same time, the population 65 years and older is predicted to increase by more than 60 percent (U.S. Census, 2005; Urban Institute, 2015).

Figure 42.
Population Growth, New York, 2000 to 2030

Source: U.S. Census, 2005

New York’s population has become both older and more diverse, and this trend is projected to continue into the next two decades for all areas of the state. The aging of the Baby Boomers has wide implications, including a smaller proportion of younger families, a more racially and ethnically diverse population of families with children, and a decrease in the working-age population.

New York’s low unemployment rate and growing economy will provide ongoing opportunities for migration, which is a leading component of population change. Domestic migration is greater than immigration in New York, though the foreign-born population increased from 20.4 percent of the overall population in 2000 to 22.6 percent in 2014 (Migration Policy Institute, 2014). Because there are still obstacles in the state to economic stability for people of color, those groups may be harder to attract, especially in areas of the state that are less diverse.

An Aging Population

Overall, New York ranks 35th in the U.S. on the well-being of its 55-and-older population – slightly below the national average, according to the Gallup-Healthways Well-Being Index. But as the Baby Boomer cohort ages, the share of the population aged 65 and over is projected to increase in nearly every country in the world by 2030. Insofar as this shift will tend to lower both labor force participation and savings rates, it raises bona fide concerns about a future slowing of economic growth and the ability to provide financial stability for those no longer able to work (Bloom, Canning, & Fink, 2011; Gallup-Healthways Well-Being Index, 2014).

With 39 percent of non-retirees nationally giving little or no thought to financial planning for retirement and 31 percent having no retirement savings or pension, the number of senior ALICE households will likely increase. During unemployment, many people draw down their retirement accounts to augment their household’s cash flow. However, this strategy comes with both short- and long-term costs. Penalties are charged for early withdrawals and retirement savings are diminished, putting future financial stability at risk. In addition, retirement plan participation has continued to decrease since the Great Recession for families in the bottom half of the income distribution. Participation rebounded slightly only for upper-middle-income families from 2010 to 2013, but it did not return to the levels seen in 2007 (Bricker, et al., 2014; Boguslaw, et al., 2013).

This shift in demographics – as well as the impact of the stock market crash, falling house prices, and periods of unemployment – will likely produce more senior ALICE households and increase their economic challenges. Many aging New York residents have seen the value of their home decline and their retirement assets dwindle at the same time that their wages – and ability to save – have also decreased. A recent AARP report on working-age adults (18 to 64 years old) found that 52 percent of New York’s private sector employees work for an employer that does not offer a retirement plan; more than 80 percent of these employees earn less than \$40,000 per year (Federal Reserve, 2015; John & Koenig, 2015).

Seniors in the workforce are bucking trends set by other generations and other age groups. During the Great Recession, workers 50 years and older were more likely to experience long-term unemployment. Combined with other financial hits, including loss of savings, declining home values, and lower-wage jobs, many senior New Yorkers have remained in the labor force longer than previous generations, and contrary to a general trend of declining labor force participation. The numbers of New Yorkers aged 16 to 64, in their prime working years, declined from 2009 to 2014. Over that same period, the number of individuals aged 65 and over in the labor force jumped by nearly 24 percent, significantly more than the 14 percent increase in that age group’s population (Office of Budget and Policy Analysis, 2015; New York City Office of the Comptroller, 2016).

More ALICE seniors will be women because they are likely to live longer than men of their generation. Generally, women have worked less and earned less than men, and therefore have smaller or no pensions and lower Social Security retirement benefits. Since women on average live longer than men, they are more likely to be single and depend on one income as they get older. Nationally in 2012, only 46 percent of women nationwide aged 65 and older were married, compared to 73 percent of men (Waid, 2013; Bureau of Labor Statistics (BLS), 2015; Hounsell, 2008; U.S. Census Bureau, 2012).

Infrastructure

The aging population, combined with other trends, will have significant consequences for ALICE households and the wider community. First, there will be increased pressure on the state’s infrastructure, especially the housing market for smaller, affordable rental units. These units will need to be close to family, health care, and other services, or

“Many aging New York residents have seen the value of their home decline and their retirement assets dwindle at the same time that their wages – and ability to save – have also decreased.”

public transportation options will need to be expanded for older adults who cannot drive, especially those in rural areas. Unless changes are made to New York’s housing stock, the current shortage will increase, pushing up prices for low-cost units and making it harder for ALICE households of all ages to find and afford basic housing. In addition, homeowners trying to downsize may have difficulty realizing home values they had estimated in better times, which they had thought would support their retirement plans (U.S. Department of Transportation, 2015; Garcia & Deitz, 2007).

There will also be increased pressure on New York’s public transportation infrastructure from older adults who cannot drive. Seniors in suburban settings and especially in rural counties in the rest of state, where access to family, health care, and other services is limited, will have difficult choices. Fixed-route and paratransit services to rural and suburban areas in New York are minimal due to cost, distances traveled, and low-density ridership. The alternatives are isolation, unsafe driving, or expensive private transit (New York State Office for Aging, 2015; Ithaca College Gerontology Institute, 2007; U.S. Department of Transportation, 2015; and Transportation for America, 2011).

Senior Living and Eldercare

The second consequence of New York’s aging population will be increased demand for geriatric health services, including assisted living and nursing facilities and home health care. But without sufficient savings, many families will not be able to afford these services. The median annual cost of a private room in a nursing home in New York is \$125,732 – one of the highest rates in the country and out of reach of most New York seniors, as the cost is 393 percent of the median annual household income in the state, according to the AARP Scorecard on Long-Term Services and Supports. In terms of other aspects of access to long-term care, New York ranked 25th in the country on an index that includes information, awareness, counseling, and quality. Notably, however, New York was the leading state in the supply of home care workers (Reinhard, et al., 2014).

The need for quality elder caregiving is already apparent. According to a 2011 study by Weill Cornell Medical College, 76 out of every 1,000 seniors in New York self-reported at least one form of abuse – financial, physical, emotional, or neglect. The term “elder abuse” applies to those over 60 years of age and includes treatment without consent, physical and sexual abuse, emotional abuse, neglect, and financial exploitation. Seniors are often reluctant or unable to come forward; the estimated elder abuse incidence rate in New York in 2011 was nearly 24 times greater than the number of cases referred to social services, law enforcement, or legal authorities. Nationally, the reported incidence of abuse is increasing (Quinn & Benson, Fall 2012; Anetzberger, October 2012; Lifespan of Greater Rochester, Weill Cornell Medical College, and the NY City Department for the Aging, 2011).

In terms of health services, older adults frequently don’t receive recommended preventative care. In 2014, 44 percent of older adults in New York got recommended preventative care, slightly above the national average of 40 percent. In addition, 10 percent of at-risk adults (age 50 or older, in fair or poor health, or have ever been told they have diabetes or pre-diabetes, acute myocardial infarction, heart disease, stroke, or asthma) had not visited a doctor for a routine checkup in the past two years, a rate only slightly better than the national average of 13 percent (McCarthy, Radley, & Hayes, 2015).

Aside from the predictable decline in physical health, seniors in New York also face mental health issues. According to the 2011 Behavioral Risk Factor Surveillance System (BRFSS) survey, in New York, 12.2 percent of 50- to 64-year-olds and 6.6

“In 2014, 44 percent of older adults in New York got recommended preventative care, slightly above the national average of 40 percent.”

percent of those 65 and older report mental distress – slightly lower than the national averages of 13 percent of 50- to 64-year-olds and 7 percent of those 65 and older. These seniors are also more likely to report poor or fair physical health (Substance Abuse and Mental Health Services Administration in partnership with the U.S. Administration on Aging, 2012).

Caregiving

The third trend as New York's population ages will be an increasing need for caregivers, both paid home health aides and unpaid family members, and both are more likely to be ALICE. Personal care aides are one of the fastest growing jobs in New York, followed closely by home health aides and nursing assistants. (Top projected occupations in the state are discussed later in this section.) These jobs involve substantial responsibility for the health of vulnerable clients, yet they only pay around \$10 per hour. In New York, they are becoming increasingly regulated: New York City's wage requirement is \$14.09 per hour in total compensation, while Long Island and Westchester's is \$9.50 per hour if health benefits are included or \$10.93 without health benefits – and those rates could be further increased as the New York state minimum wage is phased in starting in 2016. These jobs also require the worker to be there in person, which can mean travelling great distances even in bad weather and with variable hours (Home Care Association of New York State, 2014; Bercovitz, Moss, Park-Lee, Jones, & Harris-Kojetin, 2011; Redfoot, Feinberg, & Houser, 2013).

In terms of support for seniors, New York has the highest rates of professional caregivers per senior in the country. From 2010 to 2012, there were 77 personal care, psychiatric, and home health aide direct care workers per 1,000 residents age 65 or older, up from 61 between 2007 and 2009. Many of these workers are ALICE, another example of critical services that are needed in New York (Reinhard, et al., 2014).

ALICE families will likely take on more caregiving responsibilities for their own relatives because they cannot afford other care options. Currently, approximately 20 percent of households have a family caregiver, with half of those reporting income less than \$50,000, or close to the ALICE Threshold. The demand for caregivers is projected to rise across the country. At the same time, fewer family members are likely to be available to provide care. The Caregiver Support Ratio, which measures the number of people nationwide aged 45 to 64 for each person aged 80 and older, was 6.7 in 2010 and is projected to fall to 4.0 by 2030 and 2.9 in 2050. This means that the overall pool of middle-aged people who could potentially serve as caregivers to seniors will shrink significantly in the coming decades (AARP Public Policy Institute, 2015; Redfoot, Feinberg, & Houser, 2013). Recent surveys have found that this trend has already started in New York.

There are serious health and financial consequences for caregivers. In addition to the toll that caregiving takes on mental and physical health, caregivers also risk future financial instability because of reduced work opportunities, lost Social Security benefits, and reduced pensions. This reality is reflected in the high percentage of caregivers who report stress: A recent study found that in New York, almost half of caregivers (47 percent) reported experiencing a lot of stress, or were not well-rested (Reinhard, et al., 2014).

The 5.5 million military caregivers in the United States are especially vulnerable. Military caregivers helping veterans from earlier eras tend to resemble civilian caregivers in many ways; by contrast, post-9/11 military caregivers (accounting for 20 percent of military caregivers) differ systematically, according to a RAND Corporation survey. These caregivers are more likely to be overseeing a younger individual with

“Currently, approximately 20 percent of households have a family caregiver, with half of those reporting income less than \$50,000, or close to the ALICE Threshold.”

a mental health or substance abuse condition. They themselves tend to be younger (more than 40 percent are aged 18 to 30), nonwhite, veterans of military service, employed, and perhaps most significantly, not connected to a support network (Ramchand, et al., 2014).

Migration

“A large college-age population is a potential engine for a state’s future economic growth. The challenge for New York is to provide its young residents with ample job opportunities and affordable places to live.”

The perception of New York is often as a state with a high immigration rate, and with younger immigrants fueling its population growth. However, the large flows of people coming into and out of the state, broken down by age group, tell a different story (Figure 43). New York is actually attracting large numbers of college students, but is sending even more to other states. The largest net outflow of New York residents is among children under 18; the next largest is among those 65 years and older. These population flows present both opportunities and challenges for ALICE.

In 2014, the largest movement of people in New York was among those 18 to 24 years old: More than 110,000 people in that age group moved to New York, 26 percent of them from outside the United States (light blue portion of the bar in Figure 43). Of the students in that age group, 38,855 of those arriving were college students (one of the highest numbers in the country), while one-third of those leaving (32,794) were high-school graduates going to college in another state. (American Community Survey, 2007, 2010, 2012, and 2014; Stone, Van Horn, & Zukin, 2012).

A large college-age population is a potential engine for a state’s future economic growth. The challenge for New York is to provide its young residents with ample job opportunities and affordable places to live. Students who take out loans, especially those who do not graduate or find gainful employment, are at risk of becoming ALICE. In New York, the average loan default rate was 8.2 percent for student borrowers who entered repayment in 2012 and defaulted between 2012 and 2014. This is below the national default rate of 11.8 percent (Project on Student Debt, 2015; U.S. Department of Education, 2015).

The next largest movement of people was among those aged 1 to 17 years. In 2014, more than 60,000 children and teens moved to New York, and more than half of them came from outside the United States. As minors, most came with their families, reflecting inflows of people in their 20s, 30s, and 40s. Even more minors left New York, reflecting the outflow of families headed by those in their 30s and 40s.

The state has a positive inflow of people in their mid-twenties, but by the age of 30 more are leaving New York than are entering. This trend starts earlier in the rest of state, where there has been a significant outflow of people aged 25-29 and 30-34 (Blakely-Armitage, Sanders, Francis, and Vink, 2011).

Figure 43.
Population Inflows and Outflows, New York, 2014

Source: American Community Survey, 2014

International migration is playing an increasing role in New York’s racial and ethnic composition. The foreign-born population now represents 23 percent of the state total, up from 16 percent in 1990. The light blue portions of the inflow bars in Figure 43 represent the number of people moving to New York from outside the United States. The foreign-born population accounts for a larger percentage of the youngest and oldest migrants – 51 percent of those under 18 moving to New York, 26 percent of college-age migrants, 44 percent of 30- and 40-year-olds, 41 percent of mid-career-age migrants, and 50 percent of retirees (American Community Survey, 2007, 2010, 2012, and 2014); Migration Policy Institute, 2014.

There are also important differences in migration by regions over time. In general, while all areas of New York experienced population loss through the 2000s, the rate was significant in NYC and its surrounding counties, and more moderate in the rest of state. More recently, population movement has increased across all regions. In terms of foreign migration, the rest of state experienced lower but fairly steady rates of net international migration during the 2000s. There is much more movement in and out of NYC, which has turned positive every year since 2010 (Blakely-Armitage, Sanders, Francis, and Vink, 2011; New York City Economic Development Corporation, 2014).

An emerging trend for New York is the growing Hispanic population. Currently, half of New York’s immigrants were born in South America, Central America, Mexico, or the Caribbean, making Hispanics the largest immigrant group. Twenty-eight percent of immigrants are from Asia, with the largest group from China (Migration Policy Institute, 2013).

Immigrants vary widely in language, education, age, and skills. Many are well educated and financially successful in the United States. However, many other immigrant families have distinct challenges that make them more likely to be unemployed or in struggling ALICE households, including low levels of education, minimal English proficiency, and lack of access to support services if they have unauthorized citizenship status (Gonzalez-Barrera, Lopez, Passel, & Taylor, 2013).

“International migration is playing an increasing role in New York’s racial and ethnic composition. The foreign-born population now represents 23 percent of the state total, up from 16 percent in 1990.”

“As New York’s population grows, it is also becoming more racially and ethnically diverse, and this diversity is projected to increase at an even faster rate over the next two decades.”

As both employees and entrepreneurs, immigrants have been a key source of economic growth in New York, making up 27 percent of the state’s workforce (2.7 million workers) in 2013, according to the U.S. Census Bureau. Across the state there were 193,183 Latino-owned businesses with sales and receipts of \$18.2 billion, employing 86,329 people in 2007, the last year for which data is available. The state’s 196,825 Asian-owned businesses had sales and receipts of \$50.5 billion and employed 224,576 people in 2007, according to the U.S. Census Bureau’s Survey of Business Owners (American Immigration Council, 2015).

Undocumented workers are also important to New York’s economy and tax base. In 2012, undocumented immigrants paid \$1.1 billion in sales, income, and property taxes in New York, according to the Institute for Taxation and Economic Policy. Moreover, if all unauthorized immigrants were removed from the state, New York would lose \$28.7 billion in economic activity, \$12.7 billion in gross state product, and approximately 137,013 jobs. Unauthorized workers are often underpaid and are among the most vulnerable to living in ALICE and poverty-level households. According to the U.S. Chamber of Commerce, removing undocumented workers would not lead to the same number of job openings for unemployed Americans for two reasons: first, because it would remove millions of entrepreneurs, consumers, and taxpayers from the U.S. economy; and second, because immigrants and native-born workers typically do not compete for the same jobs (Gardner, Johnson, & Wiehe, April 2015; Perryman Group, 2008; U.S. Chamber of Commerce, 2013; Institute on Taxation and Economic Policy (ITEP), 2015).

The availability of low-skilled immigrant workers, such as child care providers and housecleaners, has enabled higher-income American women to work more and to pursue careers while having children (Furman & Gray, 2012). Both job opportunities and wages need to be sufficient in order to continue to attract these workers.

Racial/Ethnic Diversity and Economic Disparities

As New York’s population grows, it is also becoming more racially and ethnically diverse, and this diversity is projected to increase at an even faster rate over the next two decades. While NYC is already one of the most diverse cities in the country, the surrounding counties and the rest of state are predicted to increase in diversity, primarily through international migration. The state’s Black population is expected to increase through domestic migration. Aging will have an impact on the ethnic composition of New York’s workforce as well. As older residents retire in the next two decades, a lower percentage of the remaining working-age population will be White and a higher percentage will be Hispanic and Asian. These younger and more racially and ethnically diverse cohorts will make up an increasing share of the labor force over the next two decades and beyond. This will be most noticeable in the counties surrounding NYC and in the rest of state, where the percentage of the population that is White is much higher than in NYC (ESRI, 2012).

While attitudes about race have improved over the last few decades, the sharp economic disparities that remain indicate a deeper cause. Recent reports have found that the gaps in education, income, and wealth that now exist along racial lines in the U.S. reflect policies and institutional practices that create different opportunities for Whites, Blacks, and Hispanics, with individual behavior playing only a minimal role. Structural impediments to equity exist in the legal system, health care, housing, education, and jobs. For these reasons, it is not surprising that Blacks and Hispanics are two of the demographic groups disproportionately likely to have lower income and to be among households below the ALICE Threshold (Mishel, Bivens, Gould, & Shierholz, 2012; Shapiro, Meschede, and Osoro, 2013; Oliver and Shapiro, 2006; Cramer, 2012; Leadership Conference on Civil Rights, 2000; Agency for Healthcare Research and Quality, 2015; Goldrick-Rab, Kelchen, and Houle, 2014; Sum and Khatiwada, 2010).

A new collection of data disaggregated by racial and ethnic groups and by state illustrates how far we still are from positioning all children for success in school and in life. The Race for Results Index, which combines 12 critical developmental, health, and educational milestones, shows that New York had the sixth-best index score in the country for White children, 25th for Hispanic children, 28th for Asian children, 21st for Black children, and fifth (out of 26 states with scores) for Native American children. But scores varied greatly between groups: The index score for White children was 768 (1,000 best, 0 worst) and for Asian children was 743, while that for Hispanic children was 395, for Black children was 384, and for Native American children was 537 (Annie E. Casey Foundation, 2014).

Economic Disparities

While ALICE households consist of all races and ethnicities, New York's Black and Hispanic communities continue to face marked economic disparities. As the state's population becomes more diverse, more families will struggle on a day-to-day basis to secure adequate food and access to quality health care (Lee, 2016; Agency for Healthcare Research and Quality, 2014). Over the longer term, these groups will face ongoing obstacles to finding quality education and good jobs, which in turn will undercut their ability to accumulate wealth (Povich, Roberts, & Mather, 2013-2014).

Education

As Section VI explained, one area of particular and ongoing concern for New York's ALICE households is the achievement gap in New York's public schools. Across the state, students of color and low-income students perform lower on math and reading test scores throughout K-12 and have lower high school graduation rates, all of which makes them more likely to live in poverty or ALICE households as adults. In addition to structural issues of school funding and residential segregation that feed the achievement gap, current research shows that academic success is deeply tied to family resources, especially access to books, high-quality child care, and other goods and services that foster the stimulating environment necessary for cognitive development (Bradbury, Corak, Waldfogel, & Washbrook, 2015).

Employment and Earnings

Employment and wage differences among Whites, Blacks, Hispanics, and Asians are less pronounced in New York than some states, but Whites clearly have the highest median earnings and the lowest unemployment rate. In 2014, the median earnings for Black workers were 26 percent lower than for White workers in New York; the median earnings for Hispanic workers were 56 percent lower; and the median earnings for Asian workers were 19 percent lower. In addition, it is often harder for people of color to find employment in New York than it is for Whites. The state unemployment rate for Whites alone was 5.8 percent; for Asians, it was 5.9 percent; for Hispanics, it was 9 percent, and for Blacks, it was 11.8 percent (American Community Survey, 2007, 2010, 2012, and 2014) (Figure 44).

“While ALICE households consist of all races and ethnicities, New York’s Black and Hispanic communities continue to face marked economic disparities.”

“Blacks and Hispanics face economic and racial barriers to wealth accumulation in New York and across the U.S., including difficulty buying a home in a popular neighborhood, accessing quality financial services including a mortgage, and earning a college degree.”

Figure 44.
Median Earnings and Unemployment by Race and Ethnicity, New York, 2014

Source: American Community Survey, 2014

Assets

With less income, it follows that it is harder to save and build assets. Blacks and Hispanics face economic and racial barriers to wealth accumulation in New York and across the U.S., including difficulty buying a home in a popular neighborhood, accessing quality financial services including a mortgage, and earning a college degree.

Homeownership is the most common means of accumulating wealth, but in New York, as in the rest of the country, Blacks are more likely to be renters than homeowners. In 2014, 66 percent of Black households were living in renter-occupied units in New York compared to 28 percent of White households (American Community Survey; U.S. Census Bureau, 2015; U.S. Census Bureau, 2000).

While state level data is not available, national data provides a window into the way income disparities lead to greater wealth disparities. For example, nationally, less than half of all households have investment assets, but even among these types of assets, there are large differences by race and ethnicity. More than 44 percent of White and Asian families have a 401(k) savings plan, while 32 percent of Black families and 26 percent of Hispanic families do. Similarly, one-third of White and Asian families have an Individual Retirement Account (IRA), while less than 11 percent of Black and Hispanic families do; and more than 22 percent of White and Asian families have stocks or mutual funds, while less than 6 percent of Black and Hispanic families do (U.S. Census Bureau, 2011). With such a different base, Blacks and Hispanics are much less able to build assets for the future.

Ultimately, these issues of race, ethnicity, and financial stability are interrelated and will continue to be in the decades to come. According to the National Center for Children in Poverty, children under 18 years are more likely to live in poverty or in low-income families than the general population, and that fact is directly related to parental education and employment levels, racial and ethnic disparities, housing instability, and family structure (Jiang, Ekono, & Skinner, 2015). For this reason, trends including the predominance of low-wage jobs, a continuing lack of affordable housing, and the persistence of race-based economic disparities will have serious implications for the next generation.

JOBS

Over the last three decades, New York's economy has been impacted by a decline in its manufacturing sector as well as uneven growth across the state. New York was hit hard by the Great Recession, sustaining sharp losses in the financial industry as well as in housing and construction. While 2010 marked the technical end of the Recession, low-income families continued to struggle in New York and nationally over the four years that followed. Families at the bottom of the income distribution saw continued substantial declines in average real incomes between 2010 and 2014, while those in the top half saw, on average, modest gains (Office of Budget and Policy Analysis, 2015; Bricker, et al., 2014). The most immediate challenge to financial stability for New York's ALICE households is employment – finding jobs with wages and numbers of hours that can support a basic household budget, as well as basic work protections such as employment security, paid sick days, and access to health care. Other important sources of income for some ALICE families are government benefit programs and less commonly, income from investments.

“While 2010 marked the technical end of the Recession, low-income families continued to struggle in New York and nationally over the four years that followed.”

Unemployment and Underemployment

The unemployment rate in New York has improved since the Great Recession, falling from 8.5 percent in 2010 to 6.4 percent in 2014. However, that does not include those who are underemployed, such as those working less than a 40-hour week who want to be working more. The underemployment rate was 12.4 percent in 2014, down from 14.8 percent in 2010 (Bureau of Labor Statistics, 2010; Bureau of Labor Statistics, 2014; Bureau of Labor Statistics (BLS), 2015). According to national statistics from the Federal Reserve, half of part-time workers and one-third of underemployed workers would prefer to work more hours (Federal Reserve, 2015).

For a small but significant number of people, long-term unemployment continues to be a problem, especially older workers. As former Federal Reserve Chairman Ben Bernanke explained, “Because of its negative effects on workers’ skills and attachment to the labor force, long-term unemployment may ultimately reduce the productive capacity of our economy” (Bernanke, Recent Developments in the Labor Market, 2012; New York City Office of the Comptroller, 2016). Obviously, long spells of unemployment can also have disastrous financial consequences for low-income families.

In the current economy, pressure for additional family income often spurs teens to drop out of school in order to work. The rate for New York high school students not graduating on time was 22 percent in 2011-2012, slightly above the national average of 19 percent. Graduation rates are lower for youth in households where insufficient income drives family members to drop out of school and find jobs. Unfortunately, there are also fewer job opportunities for young people in today's economy as many part-time hourly jobs are now being taken by older workers who have lost their full-time jobs, especially in poorer areas. Across the U.S. in 2013, 16 percent of residents aged 18 to 24 were not enrolled in school, were not working, and

had no degree beyond a high school diploma or GED; in New York, that rate was 14 percent (Annie E. Casey Foundation, 2013; Annie E. Casey Foundation, 2012). Low graduation rates and high unemployment both contribute to higher rates of crime, teen pregnancy, and substance abuse.

Employment Practices

In New York, ALICE is most likely to work in industries and occupations that not only pay low wages but also have low levels of job security, no paid sick days or parental leave, and no access to health care (Schmitt, 2012; Schwartz, Wasser, Gillard, & Paarlberg, 2015; Watson & Swanberg, 2013). These industries in New York include tourism, education and health services, and transportation. The much-noted finance and information industries provide higher-wage jobs – which contribute strongly to the state’s GDP – but offer fewer jobs overall, as discussed in Section III. Yet even within seemingly high-skilled industries, there is a substantial portion of workers who provide critical support services but do not receive high wages. For example, in the professional and business services industry nationally, 26 percent of jobs are administrative and support services (Bureau of Labor Statistics, 2013).

The employment practices in many of these low-wages jobs, especially part-time jobs, make it harder for workers to earn a minimal income or plan for the future. According to the BLS, nationally, only 23 percent of part-time workers in the private sector have medical benefits available, compared to 86 percent of full-time employees. Similarly, 37 percent of part-time workers have access to retirement benefits, compared to 74 percent of full-time employees; and only 24 percent of part-time workers are offered paid sick leave, compared to 74 percent of full-time employees (Bureau of Labor Statistics, 2014).

Even within industries, employment practices can vary by employer. Within occupations, there is wide variation in wage level, job security, predictability of schedule, opportunities for advancement, and benefits. Employers who provide appropriately structured jobs make a difference for New York’s ALICE households. Research shows that these employers make a particular difference for workers with a disability, who are often disadvantaged economically and thus more likely to be ALICE (Ton, 2012; Schur, Kruse, Blasi, & Blanck, 2009).

One of the greatest economic shifts over the last 50 years has been the increase in working mothers. In 1967, 27.5 percent of mothers were primary or co-breadwinners for their families. By 2012, nearly two-thirds (63.3 percent) brought home at least 25 percent of their families’ incomes (Glynn, 2014). This shift has had a number of different repercussions for families. On the one hand, families have greater income or more diversified sources of income when there is more than one income earner. On the other, women still earn less than men and are more likely to work in low-wage jobs. These jobs typically have work scheduling policies and other practices that pose particular challenges for workers with significant responsibilities outside of their job, including caregiving, pursuing education and workforce training, or holding down a second job (Watson, Frohlich, & Johnston, 2014).

Ultimately, low wages also mean that ALICE households cannot afford to save, and the loss of a job means that any savings accumulated in better times are used to cover basic living expenses. ALICE families have both the greatest risk of job loss and the least access to resources to soften the blow. The Pew Charitable Trusts Economic Mobility Project found that families that experienced unemployment suffered not only lost income during their period of not working, but also longer-term wealth losses, compromising their economic security and mobility (Boguslaw, et al., 2013).

“Within occupations, there is wide variation in wage level, job security, predictability of schedule, opportunities for advancement, and benefits.”

The Future of Jobs in New York

The most immediate challenge to financial stability for New York's ALICE households is employment. Employment will depend on the growth of the New York economy and the kinds of jobs it produces. The impact of technology replacing jobs will also be an important factor in the future; both low-wage and high-wage jobs stand to be replaced.

Total jobs in New York are projected to grow slowly over the ten years from 2014 to 2024, but there is wide variation across industries and geographies. While attention is often focused on the recovery of top-level jobs in finance and information technology, a different group of occupations – many of them low-skilled, low-wage service jobs – will have the greatest impact on ALICE workers in the state. The implementation of the minimum wage in New York may impact these projections as well.

According to the Bureau of Labor Statistics, low-skilled jobs will have the most projected job openings from 2014 to 2024 (Figure 45). More than 80 percent of the 9,690 new jobs in the top 20 projected occupations in New York pay less than \$20 per hour (equivalent to an annual full-time salary of less than \$40,000), and most of those jobs are projected to pay between \$10 and \$15 per hour. What stands out in this table is how few occupations require a bachelor's degree (5 percent) and offer wages over \$30 per hour (13 percent). While they account for a small percentage of new job growth, these jobs offer much more financial stability for workers and their families. These occupations include 480 projected openings for general and operations managers with an hourly wage of \$52.86, and 740 openings for registered nurses with an hourly wage of \$30.89 (New York State Department of Labor, 2014).

These projections support national findings that the U.S. economy is less able to generate middle-wage jobs than in years past. According to the Center for Economic and Policy Research, workers of all ages with four years or more of college are actually less likely to have a good job (one that pays at least \$37,000 per year and has employer-provided health insurance and an employer-sponsored retirement plan) now than three decades ago (Schmitt & Jones, 2012). Similarly, the education and training levels necessary for the labor force of 2020 will not require a significantly greater level of education than workers currently possess (Thiess, 2012). The experience of recent college graduates shows that they are less likely to be gainfully employed than previous generations (Stone, Van Horn, & Zukin, 2012). With this employment outlook, the number of ALICE households will increase, as will demand for resources to fill the gap to financial stability.

The implementation of a \$15 per hour minimum wage could impact the wage levels for many of these job projections. The wage increases will be phased in from 2016 through 2021, though they can be suspended starting in 2019 after review by the Division of Budget. The state estimates that more than 2.3 million people will be affected by these increases (New York State Office of the Governor, 2016).

- For workers in New York City employed by large businesses (those with at least 11 employees), the minimum wage would rise to \$11 at the end of 2016, then increase another \$2 each year after, reaching \$15 on December 31, 2018.
- For workers in New York City employed by small businesses (those with 10 employees or fewer), the minimum wage would rise to \$10.50 by the end of 2016, then increase another \$1.50 each year after, reaching \$15 on December 31, 2019.
- For workers in Nassau, Suffolk and Westchester Counties, the minimum wage would increase to \$10 at the end of 2016, then increase \$1 each year after, reaching \$15 on December 31, 2021.

“Total jobs in New York are projected to grow slowly over the ten years from 2014 to 2024, but there is wide variation across industries and geographies.”

- For workers elsewhere in the state, the minimum wage would increase to \$9.70 at the end of 2016, then increase another 70 cents each year after, reaching \$12.50 on December 31, 2020. After that date, the wage will continue to increase to \$15 on an indexed schedule to be set by the Director of the Division of Budget in consultation with the Department of Labor.

The full implementation of the wage increase to \$15 per hour would impact 6,260 new jobs that are projected to grow in New York, affecting 67 percent of the state’s top occupations by job growth (New York State Department of Labor, 2014).

Figure 45.
Projected Occupational Demand by Wage, Education, and Work Experience, New York, 2014 to 2024

Occupational Title	2014 Employment	Annual New Growth	Hourly Wage	Education or Training	Work Experience
Personal Care Aides	24,990	1,010	\$8.93	Less than high school	None
Retail Salespersons	58,870	820	\$12.21	High school diploma or equivalent	None
Registered Nurses	41,270	740	\$30.89	Associate’s degree	None
Laborers and Freight, Hand	39,440	620	\$12.54	Less than high school	None
Secretaries and Administrative Assistants	40,400	560	\$14.42	Postsecondary non-degree award	None
Combined Food Prep, Including Fast Food	27,780	530	\$8.84	Less than high school	None
General and Operations Managers	31,060	480	\$52.86	Bachelor’s degree	Less than 5 years
Home Health Aides	11,560	470	\$10.13	Less than high school	None
Licensed Practical and Vocational Nurses	22,930	440	\$18.91	Postsecondary non-degree award	None
Cashiers	68,250	420	\$9.22	High school diploma or equivalent	None
Nursing Assistants	23,500	400	\$10.33	Postsecondary non-degree award	None
Heavy and Tractor- Trailer Truck Drivers	27,860	390	\$19.34	Postsecondary non-degree award	None
Maintenance and Repair Workers	28,650	380	\$17.60	High school diploma or equivalent	None
Janitors and Cleaners	30,050	370	\$10.49	Less than high school	None

“According to the Bureau of Labor Statistics, low-skilled jobs will have the most projected job openings from 2014 to 2024.”

Occupational Title	2014 Employment	Annual New Growth	Hourly Wage	Education or Training	Work Experience
Bookkeeping, Accounting Clerks	26,890	370	\$17.21	Associate's Degree	None
Customer Service Representatives	22,200	360	\$14.29	Postsecondary non-degree award	None
Waiters and Waitresses	34,660	350	\$9.89	Less than high school	None
Construction Laborers	23,700	350	\$14.17	Less than high school	None
Sales Representatives	25,470	330	\$28.71	High school diploma or equivalent	None
First-Line Supervisors	20,820	300	\$22.92	Associate's Degree	Less than 5 years

Jobs and Technology

Technology's influence extends to both ends of the employment spectrum: generating jobs and eliminating them in equal measure. Improved automation may put some workers out of jobs and change the activities of others (Figure 46). For ALICE workers, the impact will be mixed:

New opportunities to earn income: Technology has enabled new job opportunities, especially in the “gig” economy; these range from freelance writers to Uber drivers. Freelance and contingent (on-call) labor has more than doubled its share of the national labor force over the last 20 years, from 7 percent in 1993 to 15 percent in 2014, and is expected to grow to nearly 20 percent by 2020. These positions may help ALICE households that need to fill short-term gaps in standard employment, and they may provide more lucrative opportunities than exist in the traditional employment market. Companies have also come to value the new hiring model since it provides flexibility to scale up or down on demand, and often can be cheaper than hiring a part-time or full-time employee on staff when considering health insurance and other benefits (Wald, 2014).

Less job security: While sometimes beneficial, the type of flexibility offered by contingent or on-call work does not help ALICE households make long-term financial plans. For one, there is no job security: a lucrative job today can be gone tomorrow. In addition, independent contractor positions provide no benefits, such as health insurance and retirement plans, for ALICE families. They also lack other standard workplace protections. For example, independent contractors have no recourse under the Fair Labor Standards Act (FLSA), which mandates that eligible workers be compensated for hours worked in excess of 40 per workweek, or the Family and Medical Leave Act (FMLA), which entitles eligible workers to unpaid, job-protected leave depending on their work history with a company (Donovan, Bradley, & Shimabukuro, 2016).

Loss of low-wage jobs: Low-wage workers, especially those in jobs that involve repetitive tasks and require little education, are the most likely to lose their jobs due to technological advances. The more a job utilizes a worker's

“Freelance and contingent (on-call) labor has more than doubled its share of the national labor force over the last 20 years, from 7 percent in 1993 to 15 percent in 2014, and is expected to grow to nearly 20 percent by 2020.”

“Job schedules are increasingly variable for low-wage workers, with several consequences for ALICE households.”

judgment and analysis (usually associated with higher levels of education), the less likely it is to be replaced by technology. Among the 20 occupations with more than a 50 percent chance of being replaced by technology in New York, none require a bachelor’s degree. Many of the jobs likely to be replaced (such as janitors) are not highly coveted and are often difficult to fill (Brynjolfsson & McAfee, 2014; Frey & Osborne, September 2013).

Unstable schedules: Job schedules are increasingly variable for low-wage workers, with several consequences for ALICE households. It is difficult to maintain a household budget when the number of work hours fluctuates and a worker can’t predict her weekly or monthly income. In some cases, unstable schedules can also affect a worker’s eligibility for employer or government benefits tied to work hours. In addition, having irregular hours makes it difficult to arrange transportation and child care (Watson, Frohlich, & Johnston, 2014); Center for Law and Social Policy, 2014).

Economic change: The effects of new technology will ripple across the economic and educational spectrum. Accountants and auditors making an average of \$62,000 per year, highly educated mathematical technicians making \$45,000 per year, and nuclear reactor power operators, who make an average of \$76,000 per year, have a greater than 90 percent chance of being replaced by technology. More people-oriented professions, such as teachers, nurses, and home health aides, are less likely to be replaced by new technology (Figure 46). However, technological advances will almost certainly – with more than a 97 percent probability – render the jobs of cashiers, bookkeepers, and accountants obsolete. But many employees who use computers, know accounting, or perform administrative functions have skills that can be transferred to other jobs. The more vulnerable are people in jobs that require minimal education and provide few transferrable skills; these displaced workers will have the most difficulty finding new jobs (Frey & Osborne, September 2013).

Figure 46.

Occupations by Number of Jobs and Technology, New York, 2014

“Technology – and increasingly affordable technology – will enable more online educational options, which in turn could make education more cost-effective and worthwhile.”

Source: New York State Department of Labor, 2014; Bureau of Labor Statistics, Occupational Employment Survey Wages, 2014; Frey and Osborne, 2013.

The impact of technology on education: Technology – and increasingly affordable technology – will enable more online educational options, which in turn could make education more cost-effective and worthwhile. Colleges are enrolling more matriculated students into online courses and offering the wider community Massive Open Online Courses (MOOCs) as high-profit ventures (West, 2015). At the same time, however, technology makes it easier to create false educational organizations and to cheat unsuspecting students. As

discussed in Section VI, for-profit colleges nationwide enroll about 11 percent of all higher education students but account for nearly 50 percent of all loan defaults. The U.S. Government Accountability Office (GAO) and several state Attorneys General are investigating numerous fraudulent educational practices and money-making education schemes (State Attorneys General, 2014; U.S. Government Accountability Office, 2009; U.S. Government Accountability Office, October 7, 2010; U.S. Government Accountability Office, August 4, 2010; Cohen P. , 2015; Minnesota Attorney General's Office, 2016; United States Senate Health, Education, Labor and Pensions Committee, 2012).

Technological innovation has the potential to change the jobs landscape in New York and across the U.S. Without technological change, national projections show that the U.S. economy will be less able to generate middle-wage jobs than in years past. But the timing and the extent of that change will depend on a host of economic factors, and the implications for ALICE families are not yet clear. There are two distinct challenges: first, to make sure that current low-wage workers have the opportunity to improve both skills and wages as technology creates new jobs, so that they are not left behind; and second, to ensure that the value of service jobs that cannot be replaced by technology – from teachers to health care workers – is recognized and rewarded economically.

VOTING

Whether ALICE households have the wherewithal to improve their economic situation comes to the fore during political elections, especially because there is so much at stake in many state and national elections. Headlines such as “Rich Americans are Nearly Twice as Likely to Vote as the Poor” (Huffington Post, April 17, 2014) reinforce perceptions that lower-income households do not vote (Kavoussi, 2014). An analysis of U.S. Census data reveals that voting rates have been highest for Americans 65 years and older, non-Hispanic Whites, individuals with high levels of education, and those with relatively high incomes (File, 2015).

While higher-income groups vote at higher rates, the majority of ALICE households also vote and make up a sizable voting demographic. In fact, nationally, households with income below \$50,000 per year (near the average ALICE Threshold) vote at only slightly lower rates than wealthier households: In the 2012 presidential election, 68 percent were registered to vote compared to 76 percent of households with income above \$50,000, and 56 percent reported voting compared to 67 percent of households with income above \$50,000. ALICE voters represent a substantial bloc of the electorate, accounting for 30 percent of those registered and 28 percent of those who voted in the 2012 presidential election (U.S. Census Bureau, 2012).

ALICE voters make up an even bigger bloc of the New York electorate. In the 2014 New York gubernatorial election, voters with household income below \$50,000 per year (close to the ALICE Threshold) accounted for 36 percent of voters. In comparison, 33 percent of voters had income between \$50,000 and \$100,000, and 32 percent had income above \$100,000 (NBCNews.com, 2014) (Figure 47).

“ALICE voters represent a substantial bloc of the electorate, accounting for 30 percent of those registered and 28 percent of those who voted in the 2012 presidential election.”

“The United Way ALICE Report looks at strategies that support families earning below the ALICE Threshold now and in the near future, as well as those that might help them become financially stable in the longer term.”

IMPROVING LIFE FOR ALICE: SHORT-, MEDIUM-, AND LONG-TERM STRATEGIES

The United Way ALICE Report looks at strategies that support families earning below the ALICE Threshold now and in the near future, as well as those that might help them become financially stable in the longer term. There are two basic approaches that would make a difference for ALICE households: increase income, or reduce expenses. Short-term strategies can help a family cope with an emergency and prevent a spiral into poverty. Long-term strategies, which aim to help a family maintain financial stability and support themselves over time, are harder to achieve. Depending on how far a family’s income is below the ALICE Threshold, different strategies may be required. But all strategies play an important role: there is no one solution. Many stakeholders have a role, including friends and family, nonprofits, employers, and government. The strategies presented here are a starting point (Figure 48).

“To permanently reduce the number of ALICE households, broader and more strategic action is needed. For ALICE households to be able to support themselves, structural economic changes are required to make New York more affordable and provide better jobs.”

Figure 48.

Short-, Medium-, and Long-Term Strategies to Assist Families below the ALICE Threshold

Strategies to Assist ALICE Families			
	SHORT-TERM	MEDIUM-TERM	LONG-TERM
Friends and Family	<ul style="list-style-type: none"> • Temporary housing • Food • Rides • Child care • Caregiving for ill/elderly relatives 	<ul style="list-style-type: none"> • Loans 	<ul style="list-style-type: none"> • Support to access good employers
Nonprofits	<ul style="list-style-type: none"> • Temporary housing • Food pantries • Utility assistance • Home repair • Tax preparation • Caregiver respite • Subsidized child care 	<ul style="list-style-type: none"> • Loans and affordable financial products 	<ul style="list-style-type: none"> • Support to access good employers
Employers	<ul style="list-style-type: none"> • Paid days off • Transportation assistance 	<ul style="list-style-type: none"> • Regular work schedule • Full-time opportunities • Higher wages • Benefits • Flex-time • Telecommuting • HR resources for caregivers • On-site health services, presentations, wellness incentives 	<ul style="list-style-type: none"> • Career paths • Mentoring
Government	<ul style="list-style-type: none"> • TANF • Child care and housing subsidies • Educational vouchers and charter school options • Social Security credit for caregivers • Tax credit for caregivers 	<ul style="list-style-type: none"> • Guidelines to ensure quality, affordable housing, child care, education, health care, transportation, and financial products • Reduced student loan burden • Guidelines to ensure job safety and stability 	<ul style="list-style-type: none"> • Attract higher-skilled jobs • Strengthen infrastructure

Efforts to assist ALICE and poverty households in supporting themselves can be broken down into short-, medium-, and long-term actions. Short-term intervention by family, employers, nonprofits, and government throughout New York can be essential to supporting a household through a crisis and preventing a downward spiral into homelessness. The chief value of short-term measures is in the stability that they provide. Food pantries, TANF, utility assistance, emergency housing repairs, and child care subsidies all help stabilize ALICE households, potentially preventing much larger future costs.

To permanently reduce the number of ALICE households, broader and more strategic action is needed. For ALICE households to be able to support themselves, structural economic changes are required to make New York more affordable and provide better jobs. The cost of basic necessities – housing, child care, food, transportation, and health care – is high in New York relative to the income currently available to ALICE households. The financial stability of this population will not improve dramatically unless systemic changes are made

to the housing market and the health care delivery system. Investments in transportation infrastructure, affordable quality child care, and healthy living would also make a difference.

One of the most direct and significant ways to help ALICE would be to improve job opportunities, either by increasing the wages of current low-wage jobs or increasing the number of higher-paying jobs. How much would have to change? **In New York, 38 percent, or 3.3 million, of the state's 8.8 million jobs pay less than \$15.58 per hour, the least amount needed for each of two working parents to support their family.**

The biggest impact on income opportunity in New York would come through a substantial increase in the number of medium- and high-skilled jobs in both the public and private sectors. Such a shift would require an influx of new businesses and possibly new industries, as well as increased education and training.

In expanding job opportunities, both the kind of job and the kind of employer matter. Across industries, employers who can offer adequate wages and benefits, consistent schedules, job security, and advancement potential can make a significant difference for ALICE households.

In addition, the extensive use of alternative financial services in New York suggests that more cost-effective financial resources, such as better access to savings, auto loans, and sound microloans, would also help ALICE households become more financially stable.

Ultimately, improvements in job opportunities and a decrease in the cost of household essentials would enable ALICE households to afford to live near their work, build assets, and become financially independent.

“The biggest impact on income opportunity in New York would come through a substantial increase in the number of medium- and high-skilled jobs in both the public and private sectors.”

APPENDIX A – INCOME INEQUALITY IN NEW YORK

Income Inequality in New York, 1979–2014

Source: American Community Survey, 1979–2014

The Gini index is a measure of income inequality. It varies from 0 to 100 percent, where 0 indicates perfect equality and 100 indicate perfect inequality (when one person has all the income). The distribution of income in New York was 22 percent more unequal in 2014 than in 1979.

Sources: 1979-1999: <https://www.census.gov/hhes/www/income/data/historical/state/state4.html>, 2009: <https://www.census.gov/prod/2010pubs/acsbr09-2.pdf>, 2014: <https://www.census.gov/content/dam/Census/library/publications/2014/acs/acsbr13-02.pdf>

Income Distribution by Quintile in New York, 2014

Source: American Community Survey, 2014

Income distribution is a tool to measure how income is divided within a population. In this case, the population is divided into five groups or quintiles. In New York, the top 20 percent of the population – the highest quintile receives 54 percent of all income, while the bottom quintile earns only 3 percent. If five New York residents divided \$100 according to the current distribution of income, the first person would get \$54, the second would get \$22, the third, \$14, the fourth, \$7, and the last \$3.

APPENDIX B – THE ALICE THRESHOLD: METHODOLOGY

The ALICE Threshold – based upon the Household Survival Budget – determines how many households are struggling in a county. Using the Household Survival Budgets for different household combinations, a pair of ALICE Thresholds is developed for each county, one for households headed by someone younger than 65 years old and one for households headed by someone 65 years and older.

- For households headed by someone under 65 years old, the ALICE Threshold is calculated by adding the Household Survival Budget for a family of four plus the Household Survival Budget for a single adult, dividing by 5, and then multiplying by the average household size for households headed by someone under 65 years old in each county.
- The ALICE Threshold for households headed by someone 65 years old and over is calculated by multiplying the Household Survival Budget for a single adult by the average senior household size in each county.
- The results are rounded to the nearest Census break (\$30,000, \$35,000, \$40,000, \$45,000, \$50,000, \$60,000, or \$75,000).

The number of ALICE households is calculated by subtracting the number of households in poverty as reported by the American Community Survey, 2007–2014, from the total number of households below the ALICE Threshold. The number of households in poverty by racial/ethnic categories is not reported by the American Community Survey, so when determining the number of ALICE households by race/ethnicity, the number of households earning less than \$15,000 per year is used as an approximation for households in poverty.

Note: American Community Survey data for New York counties with populations over 65,000 are 1-Year estimates; for populations between 20,000 and 65,000, data are 3-Year estimates; and for populations below 20,000, data are 5-Year estimates. Because there was not a 5-Year survey for 2007, the data for the least populated counties (see chart below) is not available. For statewide totals, the numbers from counties are extrapolated from overall percentages. Starting in 2014, there is no 3-Year survey data, so that only 1- and 5-Year estimates are used in the ALICE calculations.

APPENDIX C – THE HOUSEHOLD SURVIVAL BUDGET: METHODOLOGY AND SOURCES

The Household Survival Budget provides the foundation for a threshold for economic survival in each county. The Budget is comprised of the actual cost of five household essentials plus a 10 percent contingency and taxes for each county. The minimum level is used in each category for 2007, 2010, 2012, and 2014. The line items and sources are reviewed below.

HOUSING

The housing budget is based on HUD's Fair Market Rent (40th percentile of gross rents) for an efficiency apartment for a single person, a one-bedroom apartment for a head of household with a child, and a two-bedroom apartment for a family of three or more. The rent includes the sum of the rent paid to the owner plus any utility costs incurred by the tenant. Utilities include electricity, gas, water/sewer, and trash removal services, but not telephone service. If the owner pays for all utilities, then the gross rent equals the rent paid to the owner.

Source: U.S. Department of Housing and Urban Development (HUD)

CHILD CARE

The child care budget is based on the average annual cost of care for one infant and one preschooler in Registered Family Child Care Homes (the least expensive child care option). Data is compiled by the New York State Office of Children & Family Services and reported to the National Association of Child Care Resource and Referral Agencies (NACCRRA, nationally known as Child Care Aware of America). When data is missing, state averages are used, though missing data may mean child care facilities are not available in those counties and residents may be forced to use facilities in neighboring counties.

FOOD

The food budget is based on the Thrifty Level (lowest of four levels) of the U.S. Department of Agriculture (USDA) "Food Plans: Cost of Food at Home, U.S. Average," June 2007. The household food budget is adjusted for six select household compositions including: single adult male 19-50 years old; family of two adults (male

and female) 19-50 years old; one adult female and one child 2-3 years old; one adult female and one child 9-11 years old; family of four with two adults (male and female as specified by the USDA) and children 2-3 and 4-5 years old; and family of four with two adults (male and female as specified by the USDA) and children 6-8 and 9-11 years old. Data for June is used as that is considered by USDA to be the annual average. New York's food costs are adjusted for regional price variation, "Regional Variation Nearly Double Inflation Rate for Food Prices," Food CPI, Price, and Expenditures, USDA, 2009.

<http://www.ers.usda.gov/media/176139/page19.pdf>

TRANSPORTATION

The transportation budget is calculated using average annual expenditures for transportation by car and by public transportation from the Bureau of Labor Statistics' Consumer Expenditure Survey (CES). Since the CES is reported by metropolitan statistical areas and regions, New York's counties were matched with the most local level possible.

Costs are adjusted for household size (divided by CES household size except for single-adult households, which are divided by two). Building on work by the Institute of Urban and Regional Development, we suggest that in the counties where 8 percent or more of the population uses public transportation, the cost for public transportation is used; in those counties where less than 8 percent of the population uses public transportation, the cost for auto transportation is used instead (Porter & Deakin, 1995; Pearce, 2015). Public transportation includes bus, trolley, subway, elevated train, railroad, and ferryboat. Car expenses include gas, oil, and other vehicle maintenance expenses, but not lease payments, car loan payments, or major repairs.

Source: <http://www.bls.gov/cex/csxmsa.htm#y0607>

HEALTH CARE

The health care budget includes the nominal out-of-pocket health care spending, medical services, prescription drugs, and medical supplies using the average annual health expenditure reported in the CES. Since the CES is reported by metropolitan areas and regions, New York's counties were matched with the most local level possible. Costs are adjusted for household size (divided by CES household size except for single-adult households, which are divided by two). The health care budget does not include the cost of health insurance.

Starting with the 2016 ALICE Reports, the health care cost will incorporate changes from the Affordable Care Act (ACA). Because ALICE does not qualify for Medicaid but in many cases cannot afford even the Bronze Marketplace premiums and deductibles, we add the cost of the "shared responsibility payment" – the penalty for not having coverage – to the current out-of-pocket health care spending. The penalty for 2014 was the higher of these: 1 percent of household income, yearly premium for the national average price of a Bronze Plan sold through the Marketplace, or \$95 per adult and \$47.50 per child under 18, for a maximum of \$285.

Source: <http://www.bls.gov/cex/csxmsa.htm#y0607>

MISCELLANEOUS

The Miscellaneous category includes 10 percent of the total (including taxes) to cover cost overruns.

TAXES

The tax budget includes both federal and state income taxes where applicable, as well as Social Security and Medicare taxes. These rates include standard federal and state deductions and exemptions, as well as the federal Child Tax Credit and the Child and Dependent Care Credit. New York income tax rates remained flat from 2007 to 2014, but the income brackets increased slightly. New York tax calculations also include the Personal Tax Credit, and for those living in NYC, additional NYC income tax.

Federal taxes include income tax using standard deductions and exemptions for each household type. The federal tax brackets increased slightly from 2007 to 2010 to 2014, though rates stayed the same. Federal taxes also include the employee portions of Social Security and Medicare at 6.2 and 1.45 percent respectively. The employee Social Security tax holiday rate of 4.2 percent was incorporated for 2012.

HOUSEHOLD SURVIVAL BUDGET

The Household Survival Budget for all household variations by county can be found at:

<http://spaa.newark.rutgers.edu/united-way-alice>

APPENDIX D – THE HOUSEHOLD STABILITY BUDGET: METHODOLOGY AND SOURCES

The Household Stability Budget represents the cost of living in each county at a modest but sustainable level, in contrast to the basic level of the Household Survival Budget. The Household Stability Budget is made up of the actual cost of five household essentials plus a 10 percent savings item and a 10 percent contingency item, as well as taxes for each county. The data builds on the sources from the Household Survival Budget; differences are reviewed below.

HOUSING

The housing budget is based on HUD's median rent for a one-bedroom apartment, rather than an efficiency, at the Fair Market Rent of 40th percentile, for a single adult; for a head of household with children, the basis is a two-bedroom apartment at the median rent. Housing for a family is based on the American Community Survey's median monthly owner costs for those with a mortgage, instead of rent for a two-bedroom apartment at the 40th percentile. Real estate taxes are included in the tax category below for households with a mortgage.

CHILD CARE

The child care budget is based on the cost of a fully licensed and accredited child care center. These costs are typically more than 30 percent higher than the cost of registered home-based child care used in the Household Survival Budget. Data is compiled by the New York State Office of Children & Family Services and reported to the national organization Child Care Aware of America.

FOOD

The food budget is based on the USDA's Moderate Level Food Plans for cost of food at home (second of four levels), adjusted for regional variation, plus the average cost of food away from home as reported by the Consumer Expenditure Survey (CES).

TRANSPORTATION

Where there is public transportation, family transportation expenses include public transportation for one adult and gas and maintenance for one car; costs for a single adult include public transportation for one, and half the cost of gas and maintenance for one car. Where there is no public transportation, family expenses include costs for leasing one car and for gas and maintenance for two cars, and single-adult costs are for leasing, gas, and maintenance for one car as reported by the CES.

HEALTH CARE

The health care costs are based on employer-sponsored health insurance at a low-wage firm as reported by the U.S. Department of Health and Human Services in the Medical Expenditure Panel Survey (MEPS). Also included is out-of-pocket health care spending as reported in the CES.

http://meps.ahrq.gov/mepsweb/data_stats/summ_tables/insr/state/series_7/2012/tviid2.htm

CELL PHONE

Most jobs now require access to the internet and a smartphone. These are necessary for work schedules, changes in start time or location, access to work support services, and customer follow-up. The Stability Budget includes the minimal cost of a smartphone for each adult in the family.

Source: *Consumer Reports, Cell Phone Plan Comparison, 2014*

<http://www.consumerreports.org/cro/news/2014/01/best-phone-plans-for-your-family-save-money/index.htm>

SAVINGS

The Household Stability Budget also includes a 10 percent line item for savings, a category that is essential for sustainability. This provides a cushion for emergencies and possibly allows a household to invest in their education, house, car, and health as needed.

MISCELLANEOUS

The Miscellaneous category includes 10 percent of the total (not including taxes or savings) to cover cost overruns.

TAXES

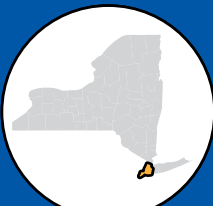

Taxes increase for the Household Stability Budget, but the methodology is the same as in the Household Survival Budget. The one difference is that a mortgage deduction is included for families who are now homeowners. In addition, while real estate taxes were included in rent in the Household Survival Budget, they are added to the tax bill here for homeowners.

HOUSEHOLD STABILITY BUDGET

Average Household Stability Budget, New York, 2014

Monthly Costs – New York Average – 2014		
	SINGLE ADULT	2 ADULTS, 1 INFANT, 1 PRESCHOOLER
Monthly Costs

The Household Stability Budget for all household variations by county can be found at: <http://spaa.newark.rutgers.edu/united-way-alice>

APPENDIX E – THE ALICE INCOME ASSESSMENT: METHODOLOGY AND SOURCES

The ALICE Income Assessment is a tool to measure how much households need to reach the ALICE Threshold compared to their actual income, which includes earned income as well as cash government assistance and in-kind public assistance. The Unfilled Gap is calculated by totaling the income needed to reach the Threshold, then subtracting earned income and all government and nonprofit spending. Household income includes wages, dividends, and Social Security.

There are many resources available to low-income families. The ones included here are those that benefit households below the ALICE Threshold, not resources that benefit society in general. For example, spending on free and reduced-price school lunches is included; public education budgets are not. Data is for 2012 unless otherwise noted.

Earned Income Tax Credit – Federal spending retrieved from <https://www.eitc.irs.gov/EITC-Central/eitcstats>

FEDERAL SPENDING

Social Services

- Temporary Assistance for Needy Families (TANF) – Provides cash assistance to low-income families.
- Social Security Disability Insurance – Provides funds to offset the living costs of disabled workers who formerly contributed to Social Security but are not old enough to draw it.
- Social Services Block Grant – Funds programs that allow communities to achieve or maintain economic self-sufficiency to prevent, reduce, or eliminate dependency on social services.

Child Care and Education

Only programs that help children meet their basic needs or are necessary to enable their parents to work are included. Though post-secondary education is vital to future economic success, it is not a component of the basic Household Survival Budget, so programs such as Pell grants are not included.

- Head Start – Provides money for agencies to promote school readiness for low-income children by providing health, education, nutritional, and social services to the children and their parents.
- Neglected and Delinquent Children and Youth Education – Supports education of children and youths in correctional institutions.
- Rural and Low-Income Schools Program - Assists rural districts in meeting their state's definition of adequate yearly progress.
- Homeless Children and Youth Education - Supports an office for coordination of the education of homeless children and youths in each state and helps ensure that homeless children, including preschoolers and youths, have equal access to free and appropriate public education.

Food

- Supplemental Nutrition Assistance Program (SNAP) – Provides money to low-income households to supplement their food budgets. Formerly Food Stamps.
- School Lunch Program – Subsidizes lunches for low-income children in schools or residential institutions.
- School Breakfast Program – Provides funds to schools to offset the costs of providing a nutritious breakfast and reimburses the costs of free and reduced-price meals.
- Child and Adult Care Food Program – Provides grants to non-residential care centers, after-school programs, and emergency shelters to provide nutritious meals and snacks.
- Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) – Provides pregnant women and children through age five with money for nutritious foods and referrals to health services.

Housing

- Section 8 Housing Choice Vouchers – Tenant-based rental assistance for low-income families; includes Fair Share Vouchers and Welfare-to-Work Vouchers, the Section 8 Rental Voucher program (14.855), or the former Section 8 Certificate program (14.857).
- Low Income Home Energy Assistance Program (LIHEAP) – Provides funds to nonprofits to help low-income homeowners afford heating and cooling costs. The program may give money directly to a homeowner or give to an energy supplier on the homeowner's behalf.

- Community Development Block Grants (CDBG) – Provide annual grants to develop decent housing and a suitable living environment and to expand economic opportunities, principally for low- and moderate-income people.
- Public Housing Operating Fund - Provides operating subsidies to housing authorities (HAs) to assist in funding the operating and maintenance expenses of their own buildings.

EITC

- Earned Income Tax Credit, Statistics for Tax Returns with EITC, 2014:
<https://www.etc.irs.gov/EITC-Central/etcstats>

HEALTH CARE

- Medicaid – Provides money to states, which they must match, to offer health insurance for low-income residents. Also known as the Medical Assistance Program.
- Children’s Health Insurance Program (CHIP) – Provides funds to states to enable them to maintain and expand child health assistance to uninsured, low-income children and, at a state’s discretion, to low-income pregnant women and legal immigrants.

STATE AND LOCAL GOVERNMENT SPENDING

Spending on ALICE was estimated from the National Association of State Budget Officers’ (NASBO) “State Expenditure Report: Examining Fiscal 2012-2014 State Spending,” which includes most data on benefits provided by New York.

New York’s state EITC is 30 percent of the federal EITC.

Source for amount spent in 2014:

New York State Department of Taxation and Finance, 2015

https://www.tax.ny.gov/pit/credits/earned_income_credit.htm

NONPROFIT ASSISTANCE

- Non-Profit Revenue for Human Services – Nonprofits as reported on Form 990EZc3 and 990c3 minus program service revenue, dues, and government grants as reported to the Internal Revenue Service. Most current data is for 2012. Data retrieved from the NCCS Data Web Report Builder, Statistics of Income 990EZc3 Report and 990c3 Report, Urban Institute.

Source: <http://nccsdataweb.urban.org/dw/index.php?page=CHome&s=1>

- Community Health Benefit – Spending by hospitals on low-income patients that includes charity care and means-tested expenses, including unreimbursed Medicaid minus direct offsetting revenue as reported on the 990c3 Report. Most current data is for 2012. Data retrieved from the NCCS Data Web Report Builder, Statistics of Income 990c3 Report for 2010, Urban Institute.

Source: <http://nccsdataweb.urban.org/dw/index.php?page=CHome&s=1>

APPENDIX F – THE ECONOMIC VIABILITY DASHBOARD: METHODOLOGY AND SOURCES

The Economic Viability Dashboard is composed of three indices: The Housing Affordability Index, the Job Opportunities Index, and the Community Resources Index. Index scores for each county range from a possible 1 (worse economic conditions for ALICE households) to 100 (better conditions). Each county's score is relative to other counties in New York. A score of 100 does not necessarily mean that conditions are very Good; it means that they are better than in other counties in the state. The indices are used only for comparison within the state, not for comparison to other states. They also provide the means to see changes over time within New York. The methodology and sources for each are presented below.

INDEX METHODOLOGY

Each index in the Dashboard is composed of different kinds of measures. The first step is therefore to create a common scale across rates, percentages, and other scores by measuring from the average. Raw indicator scores are converted to “z-scores”, which measure how far any value falls from the mean of the set, measured in standard deviations. The general formula for normalizing indicator scores is:

$$z = (x - \mu) / \sigma$$

where x is the indicator's value, μ is the unweighted average, σ is the standard deviation for that indicator, and z is the resulting z-score. All scores must move in a positive direction, so for variables with an inverse relationship (e.g., housing burden) the scores are multiplied by -1. In order to make the resulting scores more accessible, they are translated from a scale of -3 to 3 to 1 to 100.

INDICATORS AND THEIR SOURCES

Housing Affordability Index

- Affordable Housing Gap – Measures the number of units needed to house all ALICE and poverty households spending no more than one-third of their income on housing, controlled for size by the percent of total housing stock. The gap is calculated as the number of ALICE households minus the number of rental and owner-occupied housing units that ALICE households can afford.

Source: American Community Survey and ALICE Threshold calculations

- Housing Burden – Households spending more than 30 percent of income on housing

Source: American Community Survey

- Real Estate Taxes – Median real estate taxes

Source: American Community Survey, Table B25103

Job Opportunities Index

- Income Distribution – Share of income of the lowest two quintiles
Source: American Community Survey
- Unemployment Rate – U.S. Department of Labor, Bureau of Labor Statistics
Source: <http://www.bls.gov/lau/#tables>
- New Hire Wages (4th quarter) – Quarterly Workforce Indicators (QWI), U.S. Census
Source: LED Extraction Tool: <http://ledextract.ces.census.gov/>

Community Resources Index

- Education Resources – Enrollment of 3- to 4-Year-olds in preschool
Source: American Community Survey, Table B14003
- Health Resources – Percent of population under 65 years old with health insurance
Source: U.S. Bureau of the Census, Small Area Health Insurance Estimates, American Community Survey
- Social Capital – Percent of population 18 and older registered to vote. For consistency with the presidential cycle, for 2014 we use 2014 data, for 2010 we use 2010 data, and for 2007 we use 2006 data.

APPENDIX G – HOUSING DATA BY COUNTY

This table presents key housing data for each county in New York in 2014 for both owner-occupied and renter-occupied housing units. For owner-occupied units, the table presents the percent of owner units that are occupied by households with income below the ALICE Threshold and the percent of all owner-occupied units that are housing burdened, meaning that housing costs are more than 30 percent of household income. For renter-occupied units, the table presents the percent of renter units occupied by households with income below the ALICE Threshold and the percent of all renter-occupied units that are housing burdened. In addition, the table includes the Affordable Housing Gap, the number of additional rental units needed that are affordable to households with income below the ALICE Threshold so that all of these households would pay less than one third of their income on housing.

Housing Data by County, New York, 2014

APPENDIX H – KEY FACTS AND ALICE STATISTICS FOR NEW YORK MUNICIPALITIES

Knowing the extent of local variation is an important aspect of understanding the challenges facing households earning below the ALICE Threshold in New York. Key data and ALICE statistics for the state’s municipalities are presented here. Because they build on American Community Survey data, for most towns with populations over 65,000, the data are 1-Year estimates; for populations under 65,000, data are 5-Year estimates. (Starting in 2014, there are no 3-Year estimates.) The Gini coefficient shows income inequality in each municipality, varying from 0 (perfect equality) to 100 percent (perfect inequality, when one person has all the income).

Key Facts and ALICE Statistics by Municipality, New York, 2014

Municipality by County	Population	Households	Poverty %	ALICE %	Above ALICE Threshold %	Gini Coefficient	Unemployment Rate	Health Insurance Coverage %	Housing Burden: Owner Over 30%	Housing Burden: Renter Over 30%	Source, American Community Survey Estimate

APPENDIX I – HOUSEHOLDS BY INCOME

This table presents the total number of households in each county in 2014, 2012, 2010, and 2007, as well as the percent of households in poverty and ALICE. These numbers reflect the improvements to the Household Survival Budget and the ALICE Threshold.

Missing data for 2007 is due to the fact that in that year, the American Community Survey did not report data for counties with populations of less than 20,000.

APPENDIX J – ALICE COUNTY PAGES

The following section presents a snapshot of ALICE in each of New York’s 62 counties, including the number and percent of households by income, Economic Viability Dashboard scores, Household Survival Budget, key economic indicators, and data for each municipality in the county (where available).

Because state averages often smooth over local variation, these county pages are crucial to understanding the unique combination of demographic and economic circumstances in each county in New York.

Building on American Community Survey data, for counties with populations over 65,000, the data are 1-Year estimates; and for populations under 65,000, data are 5-Year estimates. (Starting in 2014, there are no 3-Year estimates.)

ALICE IN ALBANY COUNTY

2014 Point-in-Time Data

Population: 308,171 | **Number of Households:** 124,716
Median Household Income: \$60,655 (state average: \$58,878)
Unemployment Rate: 5.9% (state average: 7.3%)
Gini Coefficient (zero = equality; one = inequality): 0.45 (state average: 0.51)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
fair (50)

Job Opportunities
good (63)

Community Resources
fair (55)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

ALICE IN DUTCHESS COUNTY

2014 Point-in-Time Data

Population: 296,579 | **Number of Households:** 104,190
Median Household Income: \$71,165 (state average: \$58,878)
Unemployment Rate: 8.2% (state average: 7.3%)
Gini Coefficient (zero = equality; one = inequality): 0.44 (state average: 0.51)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
poor (30)

Job Opportunities
fair (54)

Community Resources
fair (53)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

ALICE IN GREENE COUNTY

2014 Point-in-Time Data

Population: 48,618 | **Number of Households:** 18,102
Median Household Income: \$49,864 (state average: \$58,878)
Unemployment Rate: 10% (state average: 7.3%)
Gini Coefficient (zero = equality; one = inequality): 0.44 (state average: 0.51)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
poor (49)

Job Opportunities
poor (45)

Community Resources
fair (56)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

ALICE IN MONROE COUNTY

2014 Point-in-Time Data

Population: 749,857 | **Number of Households:** 298,271
Median Household Income: \$51,217 (state average: \$58,878)
Unemployment Rate: 7.2% (state average: 7.3%)
Gini Coefficient (zero = equality; one = inequality): 0.47 (state average: 0.51)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mployed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
poor (47)

Job Opportunities
fair (51)

Community Resources
good (60)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

ALICE IN ONEIDA COUNTY

2014 Point-in-Time Data

Population: 232,871 | **Number of Households:** 90,583
Median Household Income: \$48,803 (state average: \$58,878)
Unemployment Rate: 7.5% (state average: 7.3%)
Gini Coefficient (zero = equality; one = inequality): 0.46 (state average: 0.51)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
fair (54)

Job Opportunities
poor (47)

Community Resources
fair (50)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

ALICE IN OTSEGO COUNTY

2014 Point-in-Time Data

Population: 61,778 | **Number of Households:** 23,798
Median Household Income: \$47,884 (state average: \$58,878)
Unemployment Rate: 7.7% (state average: 7.3%)
Gini Coefficient (zero = equality; one = inequality): 0.44 (state average: 0.51)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
fair (55)

Job Opportunities
fair (50)

Community Resources
fair (52)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

ALICE IN SULLIVAN COUNTY

2014 Point-in-Time Data

Population: 75,943 | **Number of Households:** 27,524
Median Household Income: \$53,219 (state average: \$58,878)
Unemployment Rate: 8% (state average: 7.3%)
Gini Coefficient (zero = equality; one = inequality): 0.45 (state average: 0.51)

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mployed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
poor (43)

Job Opportunities
poor (48)

Community Resources
poor (43)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.

How many households are struggling?

ALICE, an acronym for **A**sset **L**imited, **I**ncome **C**onstrained, **E**mloyed, are households that earn more than the U.S. poverty level, but less than the basic cost of living for the county (the ALICE Threshold, or AT). Combined, the number of poverty and ALICE households equals the total population struggling to afford basic needs.

What are the economic conditions?

The **Economic Viability Dashboard** evaluates community conditions for ALICE in three core areas. Each is an index with a scale of 1 (worse) to 100 (better).

Housing Affordability
fair (51)

Job Opportunities
fair (54)

Community Resources
poor (49)

What does it cost to afford the basic necessities?

This bare-minimum budget does not allow for any savings, leaving a household vulnerable to unexpected expenses. Affording only a very modest living in each community, this budget is still significantly more than the U.S. poverty level of \$11,670 for a single adult and \$23,850 for a family of four.
